***T**H E Utility of Decimals in all Sorts of Computations is well known to those who are acquainted with Mathematical Literature; my Design in this Treatise is to shew the particular Advantages of employing them in such Computations as occur in the Course of Trade and Business. I do not here include Mensuration and Gauging, as these useful Arts have been fully treated of in many Mathematical Books, and some Authors have written wholly on them. Indeed the Usefulness of Decimals in Computations relative to Trade, &c. has been already treated of by an eminent Hand in his Universal System of Decimal Arithmetic; but finding upon the Perusal of it, that there was still Room for several Improvements in such Computations, and that it was upon the whole better adapted to the Scholar than to the Man of Business, for whom this is chiefly intended, I thought proper to pursue the Design I had formed before seeing the said Work. I must acknowledge however, that the above System has afforded me some useful Hints towards composing this Tract, and in particular the Doctrine of Circulating Decimals is chiefly ab-*

strated therefrom, with, I think, some little Emendations, &c. which a Man of the Author's Abilities might not attend to.

Having thus touched on the general Scope of the Work, the next Thing is to inform the Reader that in prosecuting it, I have in the first Place shewn in the plainest Manner I could, how the Rules of DECIMAL ARITHMETIC, viz. Addition, Subtraction, Multiplication, Division, and Reduction, are performed; and in Reduction, besides the common Methods by Arithmetical Operations, I have shewn how it may be facilitated by Means of Tables; and particularly have contrived a Method, by which the Tables for turning the lower Species of Money, Weights, &c. into a Decimal, serve also for finding the Value of a Decimal in the known Parts of its Integer, near enough to answer any Purpose in Business.

In the next Place, by the Application of this Art, I have shewn first, that it is very useful in the common Rules of Arithmetic in general; but more particularly in the Rule of Practice, which Decimals greatly facilitate.

*In applying them to the Computation of Exchanges, which I have treated of very fully, I have sometimes worked entirely by Decimals; and sometimes (when it has been the shortest Way) used them as Auxiliaries only; I have notwithstanding given such general Methods, that the Learner may know which is the best Way of working any Question of that Kind; and have shewn not only short and new Methods of computing Exchanges, but also the Par of the Exchange between London and those Countries we exchange with, and likewise the intrinsic Value of their Monies, both
which*

P R E F A C E.

which, I believe, will be found more correct than in any Book extant. For among other Authors, I have found One that has written a Volume chiefly on Exchanges (not to say any Thing of the whole) very erroneous in this Point, notwithstanding his Book has gone through several Editions. For my own Part, I have been at some Pains to be informed in many Particulars concerning them: yet if any Errors are committed in any thing advanced in relation thereto, I hope they will be excused, and shall esteem it a Favour to be better informed.

In Interest, the shortest Methods of computing it, as well as the Knowledge of Exchanges, being very useful to the trading Part of the World, I have therefore shewn how Interest, Simple and Compound, may be computed by the Pen, and also by Tables. In computing Interest by the Pen, I have given such concise Methods as will fully convince the intelligent Reader of the great Usefulness of Decimals therein; and as to Simple Interest in particular, I have by a Decimal Table, calculated only at 5 per Cent. shewn how the Simple Interest of any Sum to 10000l. at the usual Rates per Cent. may be as readily found, as by common Tables of Interest, which would require (if calculated at 3, 3½, &c. to 5 per Cent.) no less than fifteen times the Compass in which it is here included.

As to the general Rules for solving Questions relating to Annuities at Compound Interest, as they are very intricate, and the Reason of them is not to be comprehended but by an Algebraist, I have therefore omitted them; but in their Stead have shewn how the most useful Questions in regard to finding the Amount of Annuities in Arrears, and the present Worth of Annuities, &c. are easily answered by Tables. These
with

with the other Tables of Interest, I have not only shewn how to use, but also the Manner and Reason of their Construction, in order to give the Learner a better Insight into the whole Business of Compound Interest. As to the Tables themselves, great Care has been taken to make them correct: Those of Compound Interest, not being taken from any Author without a previous Examination of every Number, and the Tables of Simple Interest are calculated entirely by myself.

Passing over Annuities on Lives, I have in the last Place given the Doctrine of Circulating or Repeating Decimals, called Repetends; the Knowledge of these indeed is not absolutely necessary in ordinary Computations, but as they are sometimes useful even in them, and moreover may be acceptable to those whose Curiosity may excite them to know the Management of Repetends, I have therefore treated of them, with their Use, &c.

Besides what has been already mentioned, many useful Things will be found in this Work, not necessary to be here particularized. I shall therefore only add, after entreating the Reader's candid Perusal of it, that I have endeavoured throughout the whole, as much as could be, to make use of such Kind of Questions as are most likely to occur in the common Transactions of Trade and Business; for it may be supposed, that those who are designed for, or engaged in Business, have not much Time to spend about abstruse Questions, or Studies more curious than useful. The Mind indeed had better be so employed than to become enervated by Indolence: And therefore the solving difficult Questions, or rather the Study of the Mathematics, to which may be added Those of a more speculative Nature, are not to be discountenanced, but on the contrary, deserve the highest Encouragements,

I N.

THE INTRODUCTION.

CONCERNING

FRACTIONS in general.

A *Fraction* supposes an *Unit*, or one Whole of any Thing to be divided into a certain Number of equal Parts, and is intended to express a Part or Parts of that *Unit* so divided. And

FRACTIONS are of two Kinds, *Vulgar* and *Decimal*.

I. A *Vulgar Fraction* is expressed by two Numbers placed one above the other with a Line drawn between them,

Thus, $\left\{ \begin{array}{l} 3 \text{ Numerator.} \\ 4 \text{ Denominator.} \end{array} \right.$

The *Denominator*, or Number placed underneath the Line, denotes how many equal Parts the Thing is supposed to be divided into, (*being only the Divisor in Division.*) And the *Numerator*, or Number placed above the Line, shews how many of those Parts are contained in the *Fraction*: (*It being the Remainder after Division.*)

In reading *Fractions*, (both *Vulgar* and *Decimal*) the *Numerator* is first mentioned, then the *Denominator*; thus $\frac{3}{4}$ is read three Fourths; $\frac{11}{12}$ is read eleven Twelfths; $\frac{9}{10}$ is read nine Tenths; $\frac{85}{100}$ is read eighty five Hundredths; and $\frac{38}{745}$ is thirty eight Seven hundred and forty fiftths; or thirty eight Parts in seven hundred and forty five. When a *whole Number* stands before

a *Fraction*, as $27\frac{5}{14}$, it is read twenty seven, and five Fourteenths; and $76\frac{14}{100}$ is read 76, and 14 Hundredths; and $35\frac{1}{31}$ is 35, and a hundred and twenty Parts in two hundred and thirty one, &c.

2. A *Decimal Fraction* is an artificial way of setting down and expressing of a natural or vulgar Fraction, as whole Numbers: And whereas the Denominators of *vulgar* Fractions are diverse, the Denominators of *decimal* Fractions are always certain: For a decimal Fraction hath always for its Denominator an Unit, with as many Cyphers annexed to it as there are Places or Figures in the Numerator, and must therefore be either 10, 100, 1000, 10,000, &c. and therefore there is no Occasion for writing it down, the usual Way of expressing a Decimal being by setting a Point before the Numerator: Thus this decimal Fraction $\frac{25}{100}$ is written .25, its Denominator being known to be an Unit with two Cyphers, because there are two Figures in the Numerator: Thus also $\frac{125}{1000}$ is written .125; $\frac{3575}{10000}$ is .3575; and $\frac{75}{1000}$ is written .075; and $\frac{6}{10000}$ is .0065.

A whole Number with a decimal Fraction, as $276\frac{14}{100}$, is thus expressed 276.14; and $74\frac{6}{1000}$ thus, 74.006, &c. And when a whole Number and a Decimal stand thus together, it is called a *mixed Number*.

As *Whole Numbers* increase in a decuple or tenfold Proportion, towards the left Hand, so, on the contrary, *Decimals* decrease towards the right Hand in a decuple Proportion, as in the following Table.

In Integers.	{	Thus, - 1	=	One, or Unity.
		10	=	Ten, or ten Units.
		100	=	One hundred.
		1000	=	One thousand.
		10000	=	Ten thousand.
		100000	=	One hundred thousand.
In Decimals.	{	<i>Vice versa.</i> .1	=	One tenth Part of an Unit.
		.01	=	One hundredth Part.
		.001	=	One thousandth Part.
		.0001	=	One ten thousandth Part.
		.00001	=	One hund. thousandth Part.
		.000001	=	One mill. Part of an Unit, &c.

Hence

INTRODUCTION.

3

Hence it appears, that as *Whole Numbers* are *increased* in a decuple Proportion by affixing Cyphers, so *Decimals* are *decreased* in the same Proportion by Cyphers being prefixed to them; thus .25, if a Cypher be prefixed to it, becomes $\frac{25}{1000}$ or .025; and .125, by prefixing 2 Cyphers, becomes $\frac{125}{100000}$ or .00125. And therefore, in writing a Decimal Fraction, whose Denominator hath more Cyphers than there are Figures in the Numerator, they must be supplied by prefixing a Cypher or Cyphers thereto, to make them equal; thus, suppose $\frac{19}{10}$ were to be written down without its Denominator, here the Denominator having 1 Cypher more than there are Figures in the Numerator, a Cypher must be prefixed to the Numerator, and the Decimal expressed thus .019.

Again, as Cyphers on the left Hand of *Whole Numbers* do not alter their Value, so Cyphers being annexed to the Right-hand of Decimals, do neither increase nor decrease the Value thereof; for $\frac{25}{1000}$ is equivalent to $\frac{25}{100}$ or .25. Hence then, Cyphers may, at any Time, be annexed to the Right hand of Decimals at Pleasure.

In all *Decimal Numbers*, if the Point of Distinction be removed one Place towards the *Right-hand*, every Figure, and consequently the whole Expression, will be increased in a tenfold Proportion; as in the following Numbers 3.756, 37.56, 375.6, 3756, which are each one 10 Times greater than the preceding one. In which Proportion also, 'tis manifest they decrease in Value, by removing the Decimal Point a Place to the *Left-hand*.

The Nature and Properties of *Decimal Numbers*, and the Method of working them (except *Repetends*, treated of in the 10th Chap.) being the same with those of *Integers* or *Whole Numbers*, renders *Decimal Arithmetic*, not only of infinite Service in *Mensuration*, *Gauging*, and many other Branches of the *Mathematics*, but also (when properly applied) of great Use in various Computations that occur in the Course of Trade and Business, as will appear in the following Work.

For the more convenient ordering of Questions according to the several Varieties that happen in Computations, it is become common in Books of Arithmetic, &c. to use the following *Signs* or *Characters*, as being a much shorter,

4 INTRODUCTION.

ter, better, and more significant Way of denoting what is to be done (in most Operations) than can otherways be expressed in Words at Length. I have therefore made use of them in this Treatise, which, with their Significations, are as follow.

Signs.	Names.	SIGNIFICATIONS.
+	$\left\{ \begin{array}{l} Plus, \text{ or} \\ more. \end{array} \right\}$	The Sign of <i>Addition</i> ; as $8+7$ is 8 more 7, and signifies that the <i>Numbers</i> 8 and 7 are to be added together.
—	$\left\{ \begin{array}{l} Minus \\ or less. \end{array} \right\}$	The Sign of <i>Subtraction</i> ; as $9-6$ is 9 less 6, and signifies that 6 is to be taken from 9.
×	$\left\{ \begin{array}{l} Multiplied \\ into \text{ or } by \end{array} \right\}$	The Sign of <i>Multiplication</i> ; as 9×6 is 9 multiplied into or by 6.
÷	$\left\{ \begin{array}{l} Divided \text{ by} \end{array} \right\}$	The Sign of <i>Division</i> ; as $8 \div 2$, is 8 divided by 2: also thus $2)8(4$ which signifies the same Thing.
=	$\left\{ \begin{array}{l} Equal \text{ to} \end{array} \right\}$	The Signs of <i>Equality</i> ; as $9=9$, or $9+6=15$, or $9-6=3$. That is, 9 is equal to 9, or 9 more 6 is equal to 15, and 9 less 6 is equal to 3, &c.
: ::	$\left\{ \begin{array}{l} Is \text{ to,} \\ So \text{ is,} \end{array} \right\}$	The Signs of <i>Proportion</i> , or <i>Rule of Three</i> , thus $2:8::6:24$ are to be read, as 2 is to 8, so is 6 to 24.

CHAP.

C H A P. I.

Of Addition, Subtraction, Multiplication, Division, and Reduction of DECIMALS.

S E C T. I. Addition of DECIMALS.

THE Numbers to be added must be placed Units under Units, and Tens under Tens, as in Whole Numbers, and the decimal Points must stand under each other, with the Decimals annexed; then add as in common Addition, and from the Sum point off so many Places for Decimals as are equal to the greatest Number of Decimal Places in any of the given added Numbers.

Examp. 1. Let 7.35, 26.324, 253.4, 46.5485, and 7.58 be added together in one Sum.

$$\begin{array}{r}
 7.35 \\
 26.324 \\
 253.4 \\
 46.5485 \\
 7.58 \\
 \hline
 \text{Sum} \quad 341.2025 \\
 \hline
 \end{array}$$

Examp. 2. Let 84.72, 856, 745.5, .647, and 78.0052 be added together.

$$\begin{array}{r}
 84.72 \\
 856. \\
 745.5 \\
 .647 \\
 78.0052 \\
 \hline
 \text{Sum} \quad 1764.8722 \\
 \hline
 \end{array}$$

These Examples are so plain, that more I think are needless.

S E C T.

S E C T. II. *Subtraction of DECIMALS.*

The same Directions being observed for placing the Numbers in Subtraction, as in Addition, it is likewise performed the same as in Whole Numbers.

E X A M P L E S.

$$\begin{array}{r}
 \text{(1)} \\
 \text{From} \quad 24.327 \\
 \text{Subtract} \quad 17.432 \\
 \hline
 \text{Remains} \quad 6.895 \\
 \hline
 \end{array}$$

$$\begin{array}{r}
 \text{(2)} \\
 \text{From} \quad .043 \\
 \text{Subtract} \quad .005 \\
 \hline
 \text{Remains} \quad .038 \\
 \hline
 \end{array}$$

$$\begin{array}{r}
 \text{(3)} \\
 \text{From} \quad 587.64 \\
 \text{Subtract} \quad 29.4856 \\
 \hline
 \text{Remains} \quad 558.1544 \\
 \hline
 \end{array}$$

$$\begin{array}{r}
 \text{(4)} \\
 \text{From} \quad 482. \\
 \text{Subtract} \quad .745 \\
 \hline
 \text{Remains} \quad 481.255 \\
 \hline
 \end{array}$$

Note, the vacant Places in the two last Examples are supposed to be supplied with Cyphers.

S E C T. III. *Multiplication of DECIMALS.*

In Multiplication of Decimals, work the same also as in Whole Numbers, and from the Product point off as many decimal Places as are both in the Multiplicand and Multiplier.

E X A M P.

E X A M P L E S.

$$\begin{array}{r}
 \text{Multiply} \quad 3.685 \\
 \text{by} \quad 2.75 \\
 \hline
 18425 \\
 25795 \\
 7370 \\
 \hline
 \text{Product} \quad 10.13375
 \end{array}$$

$$\begin{array}{r}
 \text{Multiply} \quad 672.5 \\
 \text{by} \quad .365 \\
 \hline
 33625 \\
 40350 \\
 20175 \\
 \hline
 \text{Prod.} \quad 245.4625
 \end{array}$$

If there are not in the Product so many decimal Places as there are in the Multiplicand and Multiplier, prefix Cyphers to equal that Number.

E X A M P L E S.

$$\begin{array}{r}
 \text{Multiply} \quad .10358 \\
 \text{by} \quad .103 \\
 \hline
 31074 \\
 10358 \\
 \hline
 \text{Product} \quad .01066874
 \end{array}$$

$$\begin{array}{r}
 \text{Multiply} \quad 1.0004 \\
 \text{by} \quad .00013 \\
 \hline
 30012 \\
 10004 \\
 \hline
 \text{Prod.} \quad .000130052
 \end{array}$$

When any Decimal Number is to be multiplied by 10, 100, 1000, 10000, &c. it is done by only moving the decimal Point, 1, 2, 3, or 4 Figures, &c. to the right Hand ; thus, 27.52 multiplied by 10 is 275.2 ; the same Number multiplied by 100 is 2752 ; the same multiplied by 1000 is 27520 ; and the same multiplied by 10000, the Product is 275200. &c.

Contracted Multiplication of DECIMALS.

When it happens that the Places of Decimals run far in both *Factors*, and consequently would make a very large Decimal in the Product, in such Case the Work may be contracted to as few Places of Decimals in the Product as you please, or is suitable to your Design, (three or four Places being generally sufficient;) to do which, observe the following

R U L E.

Set the *Unit's* Place of the *Multiplier* directly under *that Figure* of the decimal Part of the *Multiplicand*, *whose Place* you would preserve in the Product.

Then invert, or place all the other Figures of the *Multiplier*, in a contrary Order to the common Way.

Lastly, in multiplying always begin at the Figure of the *Multiplicand* which stands over the Figure wherewith you are then multiplying, setting down the first Figure of each particular Product directly under one another. But withal take Care to see what Increase would arise from the multiplying of the two next Right-hand Figures of the *Multiplicand*, which you must constantly add to the first Figure in every Product; that is, if the Product of the next Right-hand Figure (with as many Units added to it as there are Tens in the Product of the second Right-hand Figure) be 5, or upwards to 10, you must add or carry 1; if it be 15 or upwards to 20, you must carry 2; and if 25 or upwards to 30, you must carry 3, &c.

E X A M-

E X A M P L E I.

Let 8.74694 be multiplied by 4.5276, and let there be only 4 *Places* of Decimals retained in the Product.

Place them as before directed, and they will stand

Thus, {	8.74694	The Multiplicand as usual.
	6725.4	The Multiplier inverted.
	<hr/>	
	34.9878	
	4.3735	
	.1749	
	612	
	52	
	<hr/>	
Product	39.6026	
	<hr/>	

Here as 4 decimal Places are to be pointed off in the Product, the *Unit's Place* of the *Multiplier*, is placed under the *fourth* decimal Place of the *Multiplicand*.

The Reason of, and how great a Part of the Work is saved by, this Contraction, will appear from the Operation at large.

8.74694	
4.5276	
<hr/>	
52 48164	
612 2858	
1749 388	
43734 70	
349877 6	
<hr/>	
39.6026 45544	
<hr/>	

Hence it appears that all the Figures on the Right-hand of the Line are wholly omitted in the above Contraction, where the Product to 4 decimal Places is the same with this.

EXAMPLE II.

Multiply 576.24768 by 18.5724, and point off 4 *decimal Places* in the Product. Likewise multiply the same Numbers together, and point off *one Place* of Decimals.

1. For 4 decimal Places in the Product.

$$\begin{array}{r}
 576.24768 \\
 4275.81 \\
 \hline
 5762.4768 \\
 4609.9814 \\
 288.1238 \\
 40.3373 \\
 1.1525 \\
 .2305 \\
 \hline
 10702.3023 \text{ the Product} \\
 \hline
 \end{array}$$

2. For 1 decimal Place in the Product.

$$\begin{array}{r}
 576.24768 \\
 4275.81 \\
 \hline
 5762.5 \\
 4610.0 \\
 288.1 \\
 40.3 \\
 1.2 \\
 .2 \\
 \hline
 10702.3 \text{ the Prod.} \\
 \hline
 \end{array}$$

EXAMPLE III.

Multiply 694.6984 by .76852 to 3 *decimal Places* in the Product, and also to 1 *Place* of Decimals.

$$\begin{array}{r}
 694.6984 \\
 25867.0 \\
 \hline
 486.289 \\
 41.682 \\
 5.558 \\
 .347 \\
 14 \\
 \hline
 533.890 \text{ the Prod.} \\
 \hline
 \end{array}$$

$$\begin{array}{r}
 694.6984 \\
 25867.0 \\
 \hline
 486.3 \\
 41.7 \\
 5.6 \\
 .3 \\
 \hline
 533.9 \text{ the Product.} \\
 \hline
 \end{array}$$

The Multiplier in the last Example being an entire Decimal, the Place of Units is supplied with a Cypher.

These

These *Contractions* will be found very useful, and a little practice will render them easy.

S E C T. IV. Division of DECIMALS.

Division of Decimals is performed after the same Manner as Division of whole Numbers, but the chief Difficulty is, how to discover the Value of the Quotient, that is, how to separate the Integers from the Decimals, which however may readily be done, by due Observance of either of the following Rules, viz.

Rule 1. The *first Figure* in the Quotient is always of the same Value or Denomination with *that Figure* of the Dividend, under which the *Unit's Place* of its Product stands. Or thus ;

Rule 2. The *decimal Parts* in the Divisor and Quotient, must be always *equal in Number* to *those* of the Dividend.

From this last Rule may be deduced these four useful Directions, viz.

Direct. 1. Point off as many decimal Places in the Quotient as there are in the Dividend more than in the Divisor: Hence if the Divisor be a whole Number, the decimal Places in the Dividend and Quotient will be equal.

Direct. 2. If the Divisor is a whole Number, and has a Cypher in the Place of Units, such Cypher may be cut off or cancelled, and in consequence thereof, the Quotient must have one Place of Decimals more than the Dividend.

Direct. 3. If the Dividend has not so many decimal Places as the Divisor, Cyphers must be annexed to make them equal, and whenever the decimal Places in the Divisor and Dividend are equal, the Quotient will be whole Numbers.

Direct. 4. If after Division is finished there are not so many Figures in the Quotient, as there are decimal Places in the Dividend more than in the Divisor, such Defect must be supplied by prefixing Cyphers.

Besides these Directions (deduced from the 2d general Rule) it is necessary to add the two following, viz.

Division of Decimals.

Direct. 5. If there are more Figures in the Divisor than in the Dividend, (whether in whole or mixed Numbers) a Cypher or Cyphers must be annexed to it, and the Cyphers thus added must be reckoned as Decimals. See 2d *Examples* of the 1st and 3d *Case*.

Direct. 6. In dividing either whole, mixed, or decimal Numbers, if there be a *Remainder*, (which is generally the *Case*) you may after pointing off the Quotient (as before directed) bring down Cyphers, and continue the Division to as many Places of Decimals in the Quotient as you please, but three or four decimal Places are in general sufficient.

I shall endeavour to illustrate and explain the Whole by the following Examples.

C A S E I.

Wherein the *decimal Places* in the Dividend exceed those of the Divisor.

Example 1. Divide 822 by 24.

24)822 (34.25 the Quotient.

$$\begin{array}{r}
 72 \\
 \hline
 102 \\
 96 \\
 \hline
 60 \\
 48 \\
 \hline
 120 \\
 120 \\
 \hline
 \dots
 \end{array}$$

In this Example before the Cyphers are brought down the Quotient is 34, but there being a Remainder of 6, I first place the decimal Point on the Right-hand of the 34. and then by *Direct. 6.* continue the Quotient by bringing down Cyphers, and had there been still a Re-

mainder, it might have been continued to 4 decimal Places, as in the next Example.

Note, The Cyphers are said to be brought down, because they are always supposed to be placed at the Right-hand of the Dividend.

Examp.

Examp. 2. Divide 67 by 287.

287)67.0(.2334 Quotient.

$$\begin{array}{r}
 574 \\
 \hline
 960 \\
 861 \\
 \hline
 990 \\
 861 \\
 \hline
 1290 \\
 1148 \\
 \hline
 142 \\
 \hline
 \end{array}$$

In this Example there being more Figures in the Divisor than in the Dividend, a Cypher is annexed to it, by *Direct. 5*; then 287 in 67.0 is twice, which 2 is first pointed off for a Decimal by *Direct. 1.* and then by *Direct. 6.* the Quotient is continued to 4 Dec. Places, as in the Work.

Examp. 3. Divide 476.23 by 27.

27)476.23(17.6381 Quotient.

$$\begin{array}{r}
 27 \\
 \hline
 206 \\
 189 \\
 \hline
 172 \\
 162 \\
 \hline
 103 \\
 81 \\
 \hline
 220 \\
 216 \\
 \hline
 40 \\
 27 \\
 \hline
 13
 \end{array}$$

In this Example, after bringing down all the Figures in the Dividend, I point off two decimal Places in the Quotient by *Direct. 1.* and then continue it to 4 decimal Places by bringing down Cyphers.

Examp.

Examp. 4. Divide 2754.385 by 960.

$$\begin{array}{r}
 96 \overline{) 2754.385} (2.8691 \\
 \underline{192} \\
 834 \\
 \underline{768} \\
 663 \\
 \underline{576} \\
 878 \\
 \underline{864} \\
 145 \\
 \underline{96} \\
 49
 \end{array}$$

Here the Cypher is cut off in the Divisor, and the Decimals pointed off in the Quotient by *Direct 2*.

When the Divisor is a *single Digit*, the Quotient may be placed under the Dividend, and the decimal Points will be under each each other. See the next Example.

Examp. 5. Divide 757.35 by 4.

$$\begin{array}{r}
 4 \overline{) 757.35} \\
 \underline{189.3375} \text{ the Quotient.}
 \end{array}$$

In this short Division (for so it may properly be called) Cyphers are always supposed to be annexed, to fill up the vacant Places in the Dividend.

When the Divisor is 20, 30, 40, &c. you may also divide as above, only place the decimal Point in the Quotient one Figure backward, as in the following Example.

Examp.

Examp. 6. Divide 734.6737 by 80.

$$\begin{array}{r} 8|0)734.6737 \\ \hline \end{array}$$

9.18342 the Quot.

It often happens that Division may be performed after this short

Manner, when the Divisor has 2 Digits, as in the two next Examples.

Examp. 7. Divide 476.23 by 27.

$$\begin{array}{r} 27 \left\{ \begin{array}{l} 3)476.23 \\ \hline 9)158.7433 \\ \hline \end{array} \right. \end{array}$$

I divide here by 3, and then by 9, because $3 \times 9 = 27$, the Divisor,

Quotient $\underline{17.6381}$

Examp. 8. Divide 2754.385 by 960.

$$120 \times 8 = 960 \left\{ \begin{array}{l} 12|0)2754.385 \\ \hline 8)22.9532 \\ \hline \end{array} \right.$$

2.8691 the Quotient.

The two last Examples are only a Repetition of *Examp. 3d* and *4th*, by which the Learner may see the Advantage of this Kind of Division, (when it can be used) the Usefulness of which will further appear hereafter, particularly in *Reduction* of Decimals and the Rule of *Practice*.

In the foregoing Examples, the Dividend only has had decimal Places, all the Divisors being whole Numbers, but the following have Decimals in both Dividend and Divisor.

Examp. 9. Divide 756.5784 by 23.4.

$$\begin{array}{r}
 23.4 \overline{) 756.5784} (32.332 \\
 \underline{702} \\
 545 \\
 \underline{468} \\
 777 \\
 \underline{702} \\
 758 \\
 \underline{702} \\
 564 \\
 \underline{468} \\
 96
 \end{array}$$

Here three decimal Places are pointed off in the Quotient, by *Direct. 1.*

Examp. 10. Divide 745.3678 by 27.52, and let there be 5 decimal Places in the Quotient.

$$\begin{array}{r}
 27.52 \overline{) 745.3678} (27.08458 \\
 \underline{5504} \\
 19496 \\
 \underline{19264} \\
 23278 \\
 \underline{22016} \\
 12620 \\
 \underline{11008} \\
 16120 \\
 \underline{13760} \\
 23600 \\
 \underline{22016} \\
 1584
 \end{array}$$

In this Example, after bringing down all the Figures in the Dividend, 2 decimal Places are pointed off in the Quotient, (by *Direct. 1st,*) and then it is continued as in the 3 first Examples.

C A S E

C A S E II.

When there are *not so many decimal Places* in the Dividend as in the Divisor.

Example 1. Divide 113.4 by .4725.

$$\begin{array}{r}
 .4725)113.4000(240. \\
 \underline{9450} \\
 18900 \\
 \underline{18900} \\
 \dots\dots 0
 \end{array}$$

Here Cyphers are annexed to the Dividend, to answer the decimal Places of the Divisor, that the Quotient might be whole Numbers, by *Direct.* 3.

Examp. 2. Divide 53.2 by 2.757.

$$\begin{array}{r}
 2.757)53.200(19.2963 \\
 \underline{2757} \\
 25630 \\
 \underline{24813} \\
 8170 \\
 \underline{5514} \\
 26560 \\
 \underline{24813} \\
 17470 \\
 \underline{16542} \\
 9280 \\
 \underline{8271} \\
 1019
 \end{array}$$

Cyphers are here annexed to the Dividend, and the decimal Point in the Quotient is placed at the Right-hand of the Integers, as in the last Example, and then the Quotient is continued as usual.

C A S E III.

When after Division is finished, there are *not so many Figures* in the Quotient as there are *decimal Places* in the Dividend *more* than in the Divisor.

D

Examp.

Examp. 1. Divide .0020091 by .543.

$$\begin{array}{r}
 .543 \overline{) .0020091} \quad \text{Cyphers are prefixed} \\
 \underline{169} \quad \text{in the Quotient by Direct. 4.} \\
 3801 \\
 \underline{3801} \\
 \dots
 \end{array}$$

Examp. 2. Divide 2.38 by 5472, and let there be 5 decimal Places in the Quotient.

$$\begin{array}{r}
 5472 \overline{) 2.3800(.00043} \\
 \underline{21888} \\
 19120 \\
 \underline{16416} \\
 \dots
 \end{array}$$

In this Example I annex Cyphers to the Dividend, by *Direct. 5*; then 472 in 2.3800 is 4 Times; to the 4 in the Quotient prefix Cyphers, (as in the last Ex-

ample) and then in Order to have 5 decimal Places therein, bring down a Cypher as usual.

All these particular Directions for finding the Value of, or pointing off the Quotient, will be found to agree with the 1st *General Rule*, (Page 11) For instance; in *Examp. 3. Case 1.* the *Unit's Place* of the Divisor, falls under the Place of *Tens* in the Dividend; and therefore the first Figure in the Quotient is *Tens*: And in *Examp. 4.* the *Unit's Place* of the Divisor (had it not been cut off) would have fallen under the *Unit's Place* in the Dividend, and therefore the first Figure in the Quotient is *Units*. Again, in *Examp. 10.* the *Unit's Place* of the Divisor falls under the Place of *Tens* in the Dividend, and therefore the first Figure in the Quotient is *Tens*: And in the 1st *Examp.* of 3d *Case*, the *Unit's Place* (had there been any) would have fallen under the Place of *Thousandths* in the Dividend, and therefore the first Figure in the Quotient is *Thousandths*.

Note, This Manner of finding the Value of the Quotient (by

(by *Rule 1.*) is particularly useful in *Contracted Division*, as will appear hereafter.

It was observed in *Multiplication*, that multiplying by 10, 100, 1000, &c. was only moving the decimal Point 1, 2, or 3 Figures, &c. to the Right-hand; on the contrary, dividing by 10, 100, 1000, &c. is only moving the decimal Point, 1, 2, or 3 Figures, &c. to the Left-hand; thus 27.52 divided by 10, the Quotient is 2.752; the same divided by 100, the Quotient is .2752; the same divided by 1000, the Quotient is .02752; and if divided by 10000, the Quotient would be .002752, &c.

It may sometimes happen that the Product of a *Multiplication Sum* may be soonest obtained by *Division*; and on the contrary, the Quotient of a *Division Sum* by *Multiplication*. For Instance,

Suppose the Product of 7315×125 was required:

To do this or any Sum in *Multiplication* by *Division*; divide an Unit with Cyphers annexed by the Multiplier, and the *Quotient* will be the *Divisor*: Thus,

Given Multiplier 125)1.000(.008 the Divisor sought.

Then .008)7315.000

The Quotient 914375 = 7315×125 ,

as appears by multiplying.

$$\begin{array}{r}
 7315 \\
 125 \\
 \hline
 36575 \\
 14630 \\
 7315 \\
 \hline
 \text{Prod. } 914375
 \end{array}$$

Again, let the *Quotient* be required of 914375 divided by 125.

D 2

To

Division of Decimals.

To do this, or any Sum in *Division* by *Multiplication*, divide an *Unit* with Cyphers annexed by the *Divisor*, and the *Quotient* will be the *Multiplier*: Thus,

$$125 \overline{) 1.000} (.008 \text{ the Multiplier.}$$

1000

Then multiply
by

914375
.008

The Product

7315.000

----- = 914375 ÷ 125, as is evident from the last Example, this being the *Converse* of it.

Division of DECIMALS contracted.

In Division of Decimals the common Way, when there are many decimal Places in the Divisor, the Operations will often be long and tedious, but the Work may be very much contracted by the following

R U L E.

The Value, or Denomination of the first Figure in the Quotient being determined by the *first general Rule*, you may have what Number of decimal Places you please, by taking *as many* of the Left-hand Figures of the Divisor as you intend to have *Figures* in the *Quotient* for the first Divisor, and then take *as many* Figures of the Dividend as will answer them, and in dividing, omit, or point off, one Figure of the Divisor at each following Operation, still having a due Regard to the Increase which would arise from the Figure and Figures so omitted.

Examp. Divide 75.18264 by 2.62842, and let 3 decimal Places be in the Quotient.

The following is the Work *contracted* and also at *large*, whereby it appears that all the Figures on the Right-hand
of

of the Line, in the Operation at large, are wholly omitted in the same contracted.

The Work contracted.

The same at Length.

2.6284|2)75.183|64(28.604 2.62842)75.18364(28.604
 52 568 52568|4

22615
 21027

22615|24
 21027|36

1588
 1577

1587|880
 1577|052

11
 11

10|82800
 10|51368

131432

In this Example the *Unit's* Place of the Divisor falls under the Place of *Tens* in the Dividend, and it is required that 3 Places of Decimals be in the *Quotient*, so there must be 5 Places in all, that is, 2 Places of whole Numbers, and 3 Places of Decimals; then (in the contracted Operation) I take the 5 Left-hand Figures for the *first* Divisor, cutting off the 2; and the 64 in the Dividend being useless, is cut off also; then I proceed as in the Work, which I presume needs no further Explanation.

MORE

MORE EXAMPLES.

Divide 5171.59165 by 8.758615, and let 4 *decimal Places* be in the Quotient.

$$\begin{array}{r} 8.758615 \overline{) 5171.5916} \end{array} \begin{array}{l} 5(590.4577 \\ \dots\dots 43793075 \end{array}$$

$$\begin{array}{r} 7922841 \\ 7882754 \\ \hline \end{array}$$

$$\begin{array}{r} 40087 \\ 35034 \\ \hline \end{array}$$

$$\begin{array}{r} 5053 \\ 4379 \\ \hline \end{array}$$

$$\begin{array}{r} 674 \\ 613 \\ \hline \end{array}$$

$$\begin{array}{r} 61 \\ 61 \\ \hline \end{array}$$

$$\begin{array}{r} 66 \\ 63 \\ \hline \end{array}$$

It

Division of Decimals.

21

It is sometimes requisite to have 3 or 4 Figures more or less in the Quotient, before you begin to point off the Figures in the Divisor in order to contract the Work, as in the following Examples; in both which it is supposed necessary to have 5 *decimal Places* in the Quotient.

$$2.756756)7414.76717(2689.67118$$

$$.....5513512$$

$$\begin{array}{r} 19012551 \\ 16540536 \\ \hline \end{array}$$

$$\begin{array}{r} 24720157 \\ 22054048 \\ \hline \end{array}$$

$$\begin{array}{r} 2666109 \\ 2481080 \\ \hline \end{array}$$

$$\begin{array}{r} 185029 \\ 165405 \\ \hline \end{array}$$

$$\begin{array}{r} 19624 \\ 19297 \\ \hline \end{array}$$

$$\begin{array}{r} 327 \\ 276 \\ \hline \end{array}$$

$$\begin{array}{r} 51 \\ 28 \\ \hline \end{array}$$

$$\begin{array}{r} 23 \\ 22 \\ \hline \end{array}$$

$$1$$

Division of Decimals.

$$7.587 \overline{) 527.271} (69.49664$$

$$\dots 45522$$

$$\begin{array}{r} 72051 \\ 68283 \\ \hline \end{array}$$

$$\begin{array}{r} 37680 \\ 30348 \\ \hline \end{array}$$

$$\begin{array}{r} 73320 \\ 68283 \\ \hline \end{array}$$

$$\begin{array}{r} 5037 \\ 4552 \\ \hline \end{array}$$

$$\begin{array}{r} 485 \\ 455 \\ \hline \end{array}$$

$$\begin{array}{r} 30 \\ 30 \\ \hline \end{array}$$

$$\dots$$

The same may be said of these *Contractions* as of *those* in Multiplication, that they are very useful, as they greatly shorten the Work in many *Computations*.

i have been the larger on this Rule of *Division*, because but little can be done in *Decimal Arithmetic*, without a perfect Knowledge of it.

S E C T V. *Reduction of DECIMALS.*

In *Reduction* of Decimals are *three Cases*.

First, To reduce or bring a *vulgar Fraction* to a *Decimal*.

Secondly, To reduce any known Part or Parts of *Money*, *Weight*, *Measure*, &c. to a *Decimal*. By these two *Cases* Questions are prepared for decimal Operation.

Thirdly, To find the Value of a *Decimal*, in the known Parts of *Money*, *Weight*, *Measure*, &c. This is the *Converse* of the last *Case*.

CASE

C A S E I.

To reduce a *Vulgar Fraction* to a *Decimal*,

Divide the *Numerator* by the *Denominator*, as if both were whole Numbers.

E X A M P L E S.

What are the Decimals *equivalent* to the *Fractions* $\frac{1}{4}$, $\frac{1}{2}$, and $\frac{3}{4}$.

(1) $\begin{array}{r} 4 \overline{) 1.00} \\ \underline{.25} \end{array}$	(2) $\begin{array}{r} 2 \overline{) 1.0} \\ \underline{.5} \end{array}$	(3) $\begin{array}{r} 4 \overline{) 3.00} \\ \underline{.75} \end{array}$
<i>Answer</i> , $\frac{1}{4} = .25$,	$\frac{1}{2} = .5$, and	$\frac{3}{4} = .75$.

E X A M P L E IV.

Reduce $\frac{4}{7}$ to a *Decimal*.

The Dec. required,	$\begin{array}{r} 7 \overline{) 4.0} \\ \underline{.514285} \\ .5714285 \end{array}$	Cyphers are here supposed to fill up the vacant Place in the Dividend, as was ob- served in Division.
--------------------	--	---

If after the Quotient is continued to 4, 5, or 6 decimal Places, (agreeable to *Direct. 6.* in *Division*) there be still a *Remainder*, (as in the above Example) no further Notice is taken of it.

E X A M P L E V.

Reduce $\frac{3}{8}$ of *Pound Sterling* to the *Decimal* of a *Pound*.

$\begin{array}{r} 8 \overline{) 3.0} \\ \underline{.375} \end{array}$	$\frac{3}{8}$ the Answer, i. e. $\frac{\text{£.}}{8} = .375$.
E	E X A M.

EXAMPLE VI.

Reduce $\frac{67}{237}$ of a *Pound* to the *Decimal* of a *Pound*.

$$237 \overline{) 67.0} \begin{matrix} \text{£.} \\ \end{matrix} (.2334, \text{ \&c. the Answer.}$$

See the 2d *Example* of *Division* for the Operation at
at large.

EXAMPLE VII.

Reduce $\frac{3}{48}$ of a *Hundred Weight* to the *Decimal* of a *Hund*.

$$6 \times 8 = 48 \left\{ \begin{array}{l} 6 \overline{) 3.0} \\ 8 \overline{) .50} \end{array} \right. \text{ Answer } \begin{matrix} \text{C.} & \text{C.} \\ \frac{3}{8} = & .0625. \end{matrix}$$

$$\begin{array}{r} \underline{.0625} \end{array}$$

EXAMPLE VIII.

Reduce $\frac{117}{156}$ of a *Pound Weight* to a *Decimal*.

$$\begin{array}{r} \text{£} \\ 156 \overline{) 117.0} \begin{matrix} \text{£} \\ \end{matrix} (.75 \text{ the Answer.} \\ \underline{1092} \\ 780 \\ \underline{780} \\ \dots \end{array}$$

EXAM

EXAMPLE IX.

Reduce $7\frac{3}{456}$ *Hogheads* into Decimals.

$\overset{\text{H}^d.}{3.496} \overset{\text{H}^d.}{3.0000} \overset{\text{H}^d.}{(.000858}$, hence $7\frac{3}{456} = 7.000858$ the
 $\underset{27968}{}$ Answer.

$$\begin{array}{r}
 .20320 \\
 17480 \\
 \hline
 28400 \\
 27968 \\
 \hline
 \end{array}$$

C A S E II.

To reduce any known Part or Parts of *Money, Weight, Measure, &c.* to a *Decimal*, there are *three Ways* or *Methods*, which are as follows.

Method 1. First bring the *different Species* given into a *Vulgar Fraction*, by reducing them to the *lowest Denomination* they consist of for the *Numerator*, and reduce the *Integer* to the *same Denomination* for a *Denominator*; then bring the *Vulgar Fraction* to a *Decimal*. (By *Case I.*)

Reduction of Decimals.

Exam. 1. What *Decimal Part* of a *Pound* is $16 : 5\frac{1}{4}$? s. d.

s. d.	l.
First, $16 : 5\frac{1}{4} = 791$ Farth.	And the <i>Integer</i> $1 = 960$ Farth.
12 the Numer.	20 the Denom.
<hr/>	<hr/>
127	20
4	12
<hr/>	<hr/>
791	240
<hr/>	4
	<hr/>
	960
	<hr/>

Then divide by $960 = 8 \times 120$ $\left\{ \begin{array}{l} 8 \overline{) 791.0} \\ 12 \overline{) 0} 98.875 \end{array} \right.$

.82396 nearly,
the An^r.

That is $16 : 5\frac{1}{4} = \frac{127}{155} = .82396$

Note, When the last Remainder is half or more than Half of the Divisor, it is common to add 1 to the last Figure in the Quotient, as in the above Example, where the 12's in 70 is 5 Times, but the Remainder being 10, the last Figure in the Quotient is therefore 6.

In this, as well as the 1st Case, it is sufficient to continue the Quotient only to 4, 5, or 6 Decimal Places.

Exam^p.

Exam. 2. What Decimal Part of a *Pound* is $8 : 6\frac{3}{4}$?

<i>s.</i>	<i>d.</i>	<i>l.</i>
8	6 $\frac{3}{4}$	1 the <i>Integer.</i>
12		20
—		—
102		20
8		12
—		—
819	<i>Eighths of a Penny.</i>	240
—		8
		—
		1920 <i>Eighths of a Penny.</i>
		—

Then, $192|0819.(\cdot 4265, \&c.$ the Answer.

That is, $8 : 6\frac{3}{4} = \frac{819}{1920} = .4265, \&c.$

Exam. 3. What Decimal Part of a *Hundred Weight* is $3 : 14$?

<i>Q. lb.</i>	<i>C.</i>
3 : 14	1 the <i>Integer.</i>
28	4
—	—
98	4
<i>Pounds.</i>	28
	—
<i>C.</i>	1.12 <i>Pounds.</i>

Then $112|98.0(.875$ the Answer.

That is, $3 : 14 = \frac{98}{112} = .875$

Note, If the Learner is not well acquainted with the common Tables of *Weights, Measures, &c.* let him consult the Tables in the next section, by which he will see how many of the smaller Denominations are contained in the next greater, &c.

Exam.

Examp. 4. What Decimal Part of a *Tun* W^t is 15 : 1 : 27 ? C. q. lb.

First, C. Q. lb.
 15 : 1 : 27 = 1735 *Pounds the Numerator.*
 And 1 Tun = 2240 *Pounds the Denominator.*

Then, Tun.
 2240)1735.(.7746 nearly, the Answer.

Examp. 5. What Decimal Part of an *Ounce Troy* is 12 : 3 ? P.w. gr.

First, P.w. gr.
 12 : 3 = 291 *Grains.*
 And 1 oz. = 480 *Grains.*
 Then 480 $\left\{ \begin{array}{l} 6)291. \\ 8|0)48.5 \end{array} \right.$
.60625 Oz. the Answer.

Ex. 6. What Decimal Part of a *Pound Troy* is 8 : 12 : 16 ? Oz. P.w. gr.

First, Oz. P.w. gr.
 8 : 12 : 16 = 4144 *Grains.*
 And 1 Pound = 5760 *Grains.*
lb
 Then 5760)4144.(.7194, &c. the Answer.

Examp. 7. What Decimal Part of a *Ton Wine* is 2 : 43 ? Hhd. Gal.

First, H. G.
 2 : 43 = 169 *Gall.*
 And 1 Ton = 252 *Ton.*
 Then 252)169.0).(.6706, &c. the Answer.

Exam.

Examp. 8. What Decimal Part of a Year is 235 Days?

First, 235 Days is $\frac{235}{365}$ of Year,

And $365)235.0(.6438$, &c. the Answer.

Method 2. Find what *Decimal Part* the *least Denomination* of the given *Species*, is of the next *Superior*, to which prefix the given Part of the next *superior Denomination*; then see what *Decimal Part* this *mixt Number* is of the next *superior Denomination*, to which again prefix what is *given of it*; and thus proceed till you ascend to the *Integer* itself, and find what *Decimal Part* of it the last *mixed Number* is, which will be that sought.

The following are the *Examples* in the 1st *Method* repeated.

Examp. 1. What Decimal of Pound is 16 : 5 $\frac{3}{4}$? s. d.

$$\begin{array}{r} 4)3.0 \\ \hline 12)5.75 \\ \hline 20)16.4792 \\ \hline \end{array}$$

Here I divide first the 3 Farthings by 4, and the Quotient is .75, the Decimal of one Penny for 3 Farthings; to the .75 I next prefix 5 Pence, and the *mixed Number* 5.75 being divided by 12, the Quotient is .4792, the Decimal of one Shilling for 5 $\frac{3}{4}$ d; then to the .4792 I prefix 16 Shillings, and 16.4792 being divided by 20 the Quotient is .82396 *l.* nearly, the Answer.

This Example being understood, the following will need but little Explanation.

Examp.

Examp. 2. What Decimal of a *l.* is $8 : 6\frac{3}{8}$?

$$\begin{array}{r} 8 \overline{) 3.0} \\ \hline \end{array}$$

$12 \overline{) 0.375}$ the Dec. of one Penny for $\frac{3}{8} d$, with 6 *d.* prefixed.

$210 \overline{) 8.5312}$, &c. the Dec. of a Shill. for $6\frac{3}{8} d$. with 8 *s.* prefixed.

Answ. $\underline{\underline{.42656}}$, &c. the Dec. of a Pound.

Examp. 3. What Decimal of a *Hundred Weight* is $3 : 14$? Qrs. *lb.*

$$28 \left\{ \begin{array}{l} 4 \overline{) 14.} \\ 7 \overline{) 3.5} \end{array} \right.$$

$4 \overline{) 3.5}$ the Dec. for 14 *lb.* with 3 *qrs.* prefixed,

Answer, $\underline{\underline{.875}}$ the Dec. of a C.

Examp. 4. What Decimal of a *Ton Weight* is $15 : 1 : 27$? C. qrs. *lb.*

$$28 \left\{ \begin{array}{l} 4 \overline{) 27.} \\ 7 \overline{) 6.75} \end{array} \right.$$

$4 \overline{) 1.96428}$ the Dec. for 27 *lb.* with 1 *qr.* prefixed.

$210 \overline{) 15.49107}$ the Dec. for 1 *qr.* 27 *lb.* with 15 C. prefixed.

Answer, $\underline{\underline{.774553}}$ the Dec. of a *Tun*,

Method 3. The *third* Method for finding the Decimal of any Part or Parts of *Money, Weight, Measure, &c.* is by *Tables* ready calculated for that Purpose

This Method being the most easy and expeditious, I have therefore at the End of this *Cap.* inserted some of the most useful *Decimal Tables*, by which the different Parts of *Money, Weight, &c.* are with great Facility turned into Decimals. As to the Manner of using them (in this Respect, for I shall hereafter shew their Use in another the following Examples (which are the same as before) will obviate.

Examp. 1. What Dec. Part of a *l.* is 16 s. d. : 5 $\frac{3}{4}$?

In <i>Table 1.</i> of <i>Money</i> , you find	
against 16 Shil. the Decimal	.8
And in <i>Table 2.</i> against 5 $\frac{3}{4}$ <i>d.</i> the Decimal	.023958
The Sum is the Answer,	.823958

Examp. 2. What Decimal of a *Hundred Weight* is 3 qrs. lb. : 14?

In <i>Table 1.</i> <i>Avoirdupois Weight one C.</i> the Integer,	
against 3 <i>qrs.</i> is - - -	.75
In <i>Table 2.</i> against 14 <i>lb.</i> is - - -	.125
The Answer,	.875

Examp. 3. What Dec. of a *Ton Weight* is 15 C. qrs. lb. : 1 : 27?

In <i>Table 1.</i> <i>Avoirdupois Weight one Ton</i> the Integer,	
against 15 <i>C.</i> is - - -	.75
<i>Table 2.</i> against 1 <i>qr.</i> 27 <i>lb.</i> is - - -	.024554
Answer,	.774554

Examp.

Examp. 4. What Dec. of an Ounce Troy is $\begin{matrix} \text{P.w.} & \text{gr.} \\ 12 & : & 3 \end{matrix}$?

In Table 1. Troy Weight, one Ounce the Integer.

Against 12 P.w. is - - .6

Table 2. Against 3 gr. is - - .00625

Answer, .60625

Examp. 5. What Dec. of a Pound Troy is $\begin{matrix} \text{Oz.} & \text{P.w.} & \text{gr.} \\ 8 & : & 12 & : & 16 \end{matrix}$?

In Table 1. Troy Weight, one Pound the Integer,

Against 6 oz. is - - .5

Table 2. Against 2 oz. 12 P.w. is .216666

Table 3. Against 16 gr. is .002778

Answer, .719444

Examp. 6. What Dec. of a Ton Wine is $\begin{matrix} \text{Hd.} & \text{G.} \\ 2 & : & 43 \end{matrix}$?

In Table 1. Wine Measure, against 2 Hds. is .5

Table 2. Against 43 Gal. is .170635

Answer, .670635

Examp. 7. What Dec. of a Year is 235 Days?

In Table 1. Of Time, against 200 Days is .547945

Table 2. Against 35 Days is .09589

Answer, .643835

These Examples I presume are abundantly sufficient to shew the Method of using these Tables in turning the different Parts of Money, Weight, &c. to a Decimal. The Decimal indeed of some few Quantities may as readily be known without them; for instance, the Decimal of any Number of Shillings, supposing a Pound the Integer, is found by only taking the Half of them; thus the Half of 10 is .5, the Decimal of 10 Shillings; and the Half of 15 (supposing a Cypher annexed) is .75 the Decimal of 15 Shillings. In the same Manner may the Decimal of any Number of Nails be found, the Integer being an Ell English; thus the Decimal of 3 Nails is .15 of an Ell, and the Decimal of 3 Quarters and 3 Nails = 15 Nails, is .75 of an Ell. In like Manner also the Decimal of any Number of Hundreds is known, the Integer being a Ton Weight. In short, 'tis plain that by this Method the Decimal of any Vulgar Fraction, having 10 for its Denominator, is discovered, for the above Shillings, Nails, &c. may be considered as such Fractions; thus 10 Shillings is equal to $\frac{10}{20}$, or .5 of a £. and 3 Nails is equal to $\frac{3}{20}$, or .15 of an Ell, &c.

C A S E III.

To find the *Value* of a *Decimal*, or to *reduce* it into the known Parts of *Money*, *Weight*, *Measure*, &c.

R U L E.

Multiply the given Decimal by the *Number of Units* contained in the next *lower* Denomination, and from the Product point off as many decimal Places as there are in the Decimal given; multiply these Decimal Places pointed off by the *Number of Units* contained in the next *lower* Denomination, and proceed after this Manner to the *lowest* Denomination required, and the *whole Numbers* in the several Products, will be the several Parts of the Quantity sought.

But it may be proper to observe, that it is *not always* necessary to reduce the given Decimal into the *very lowest* Denomination of the respective *Weight*, *Measure*, &c. For it would be needless to reduce the Decimal of a Ton Weight,

Weight, to an Ounce, or a Dram; or the Decimal of a Ton of Wine to so small a Quantity as a Pint, as the Weight in the one Case to a *Pound*, and the Measure in the other to a *Gallon*, may reasonably be supposed to be exact enough to answer any Purpose in Business. This being premised, I shall next proceed to the Examples.

EXAMPLE I.

Reduce .78175 of a *Pound Sterl.* into the known Parts thereof.

$$\begin{array}{r}
 .78175 \\
 20 \\
 \hline
 s. \text{ ---} \\
 15 .63500 \\
 12 \\
 \hline
 d. \text{ ---} \\
 7 .62000 \\
 4 \\
 \hline
 q. \text{ ---} \\
 2 .48000 \\
 \hline
 \hline
 \end{array}$$

Here I multiply by 20, by 12, and by 4, agreeable to the above Rule, which produces the Answer, 15 s. 7¹/₂ d. 48

That the last Example might be as plain as possible, I have multiplied the Cyphers on the Right-hand of the Products, but as Cyphers on the Right-hand of Decimals are of no Value, I shall therefore not multiply them when they occur in any of the following Examples.

EXAMPLE II.

Reduce .6023 of a *Pound Avoirdupois* into the known Parts thereof.

$$\begin{array}{r}
 .6023 \\
 16 \\
 \hline
 9.6368 \\
 16 \\
 \hline
 10.1888 \\
 \hline
 \hline
 \end{array}$$

 \end{array}$$

Answer, Hd. G.
 2 : 30.5 &c.

EXAM-

EXAMPLE VII.

Reduce .672 of a Year into Days.

$$\begin{array}{r}
 305 \\
 \hline
 3160 \\
 4032 \\
 2016 \\
 \hline
 \hline
 \text{Answer, } 245.280 \text{ Days.}
 \end{array}$$

It was shewn in the *last Case* how to turn the different Parts of *Money, Weight, &c.* into Decimals by *Tables* calculated for that Purpose; and as the Operations in this Case are somewhat tedious, Mr. *Marten*, in his *System of Decimal Arithmeti.*, has inserted a Set of Tables which he invented for the more easy finding the Value of any Decimal in the known Parts thereof. But I have here contrived a Method whereby the Tables for turning *into* Decimals, serve also to turn *out*, or to find the Value of a Decimal, (sufficiently exact for Business) and that in the following easy and expeditious Manner.

Seek in the first of those Tables where the *Integer* is of the same Denomination with the *Decimal whose Value is required*, for the *Decimal next less* to the *Decimal given*, which *subtract* from the same; and in the second Table seek for the *Decimal next less* to the *Remainder*, and the Quantities answering to the Decimals thus found will be the Answer.

If there are three Tables to an *Integer* (but that is very seldom requisite) as in *Troy Weight*, where the *Integer* is a Pound, first subtract the *Decimal* in the 1st Table *next less* to the given Decimal, and from the Remainder subtract the *next less* Decimal in the 2d Table.

The ingenious Practitioner may generally save himself the Trouble of applying to the 1st Tables; for, excepting the 1st Table of Avoirdupois Weight *one Pound* the Integer, and the 1st Table of Time; the Decimals in them, and the Quantities answering thereto, may with the least Consideration be known without referring to them. So
that

that upon the Whole, this Method of finding the Value of a Decimal will be found both easy and expeditious, as will appear from the following Examples. (Which are a Repetition of the last.)

Note, In subtracting one Decimal from another, 4 Places of Decimals will be sufficient, but if in taking out the Numbers from the Tables the 5th Figure be 5 or upwards, 1 may be added to the Figure preceding it.

E X A M P L E I.

What's the Value of .78175 of a *Pound Sterling*?

In *Table 1. Of Money*, you will find that the Decimal *next less* to the Decimal given is .75 equal in Value to 15 Shillings.

Then from .78175
Subtract .75 = 15 s.

Remains .0317 = 7½ d. (nearly) the Value of the *next less* Decimal
(.03125) as appears by *Table 2d.* Hence the Answer is 15 s. 7½ d.

E X A M P L E II.

What's the Value of .6023 of a *Pound Avoirdupois*?

From .6023
Sub. .5625 = 9 oz. per *Table 1. Avoirdupois Weight*,
one Pound the Integer.

Remains .0398 = 10 Drums nearly, by *Table 2d.*

Hence the Answer is 9 Oz. 10 Dr.

EXAMPLE III.

What's the Value of .6723 of a *Hundred Weight*?

From	.6723	
Sub.	.5	= 2 qrs. <i>per Table 1. Avoirdupois</i>
	<hr/>	<i>Weight, one C. the Int.</i>
Remains	.1723	= 19 lb. nearly, by <i>Table 2.</i>
	<hr/>	

Answer, 2 qrs. 19 lb.

EXAMPLE IV.

What's the Value of .6445 of a *Ton Weight*?

From	.6445	
Sub.	.6	= 12 C. <i>per Table 1. Avoirdupois</i>
	<hr/>	<i>Weight, one Ton the Int.</i>
Remains	.0445	= 3 qrs. 15 lb. nearly, by <i>Table 2.</i>
	<hr/>	

Answer, 12 C. 3 qrs. 15 lb.

EXAMPLE V.

What's the Value of .4653 of a *Pound Troy*?

From	.4653	
Sub.	.25	= 3 oz. <i>per Table 1. Troy</i>
	<hr/>	<i>Weight, 1 Pound the Int.</i>
Remains	.2153	
From which subtract	.2125	= 2 oz. 11 P.w. <i>per Table 2.</i>
	<hr/>	
Remains	.0028	= 16 gr. nearly, by <i>T. 3.</i>
	<hr/>	

Hence the Answer is 5 oz. 11 P.w. 16 gr.

E X A M-

EXAMPLE VI.

What's the Value of .6213 of a Ton Wine?

From .6213
 Sub. .5 = 2 Hds. per Table 1. Wine Measure.

Remains .1213 = 30 Gallons nearly, by Table 2.

Answer, 2 Hds, 30 Gal.

EXAMPLE VII.

What's the Value of .672 of a Year?

From .672
 Sub. .5479 = 200 Days, per Table 1. Of Time.

Remains .1241 = 45 Days nearly, by Table 2.

Answer, 245 Days.

Besides the two general Methods in this Case for finding the Value of Decimals, there is still a shorter Way than either of finding the Value of the Decimal of a *Pound Sterling*, (and without referring to any Decimal Table) the Usefulness of which will fully compensate for the little Difficulty there may be in the learning of it; for it may be observed, that the Value of the Decimal of a *Pound Sterl.* is more generally wanted in mercantile Computations, than the Value of all other Decimals of whatever Denominations, taken together.

This compendious Method is thus performed.

Double the first Figure, (or Place of Tenths), and it makes so many Shillings; and if the next Figure be 5, or more than 5, for the 5 add another Shilling to the former Shillings; then for every Unit in the second Place count ten, and to that add the Figure in the third Place, and
 G 2 reckon

reckon that so many Farthings; but if they make above 13, abate 1; and if above 38 abate 2, and add the remaining Farthings to the Shillings before found.

Examp. What is the Value of .695 of a Pound *Sterl.*

First double the 6, and it makes 12 s. then take 5 out of 9, and for that reckon another Shilling, and it makes 13 s. and the four remaining is 4 Tens, which with the 5 make 45; this being above 38, abate 2, and the Remainder is 43 Farthings. So the Answer is 13 s. 10 $\frac{3}{4}$ d.

Note 1. If the Decimal whose Value is required contains more than *three* Places or Figures, and if the *fourth* Figure be 5 or upwards, another Farthing must be added, but if less than 5, no Notice need be taken of it.

2. If the Decimal has but *two* Places, a Cypher must be supposed to supply the *third* Place. Hence .31 of a *l.* must be reckoned .310, which by the above Rule comes to 6 s. 10 $\frac{1}{2}$ d.

More *Examples*, with their Answers.

<i>l.</i>	<i>s.</i>	<i>d.</i>	<i>l.</i>	<i>s.</i>	<i>d.</i>	<i>l.</i>	<i>s.</i>	<i>d.</i>
.796	= 15	: 11	.4767	= 9	: 6 $\frac{1}{2}$.77	= 15	: 4 $\frac{3}{4}$
.654	= 13	: 1	.9489	= 18	: 11 $\frac{3}{4}$.69	= 13	: 9 $\frac{1}{2}$
.528	= 10	: 6 $\frac{3}{4}$.0963	= 1	: 11	.08	= 1	: 7 $\frac{1}{4}$

S E C T VI. *Common Tables of MONEY,
WEIGHTS, MEASURES and TIME.*

TABLE I. *Money.**Farthings,*

$$\begin{aligned} 4 &= 1 \text{ Penny,} \\ 48 &= 12 = 1 \text{ Shilling,} \\ 960 &= 240 = 20 = 1 \text{ Pound.} \end{aligned}$$

TABLE 2. *Troy Weight.**Grains,*

$$\begin{aligned} 24 &= 1 \text{ Pennyweight,} \\ 480 &= 20 = 1 \text{ Ounce,} \\ 5760 &= 240 = 12 = 1 \text{ Pound.} \end{aligned}$$

By this Weight are weighed, *Jewels, Gold, Silver, Corn, Bread,* and all *Liquors*. The *Pound Troy* is divided by the *Apothecaries* as in the following Table.

TABLE 3. *Apothecaries' Weight.**Grains,*

$$\begin{aligned} 20 &= 1 \text{ Scruple,} \\ 60 &= 3 = 1 \text{ Dram,} \\ 480 &= 24 = 8 = 1 \text{ Ounce,} \\ 5760 &= 288 = 96 = 12 = 1 \text{ Pound.} \end{aligned}$$

By these *Weights* the *Apothecaries* compound their *Medicines*, but buy and sell their *Drugs* by *Avoirdupois Weight*.

TABLE 4. *Avoirdupois Weight.**Drams,*

$$\begin{aligned} 16 &= 1 \text{ Ounce,} \\ 256 &= 16 = 1 \text{ Pound,} \\ 7168 &= 448 = 28 = 1 \text{ Quarter,} \\ 28672 &= 1792 = 112 = 4 = 1 \text{ Hundred,} \\ 573440 &= 35840 = 2240 = 80 = 20 = 1 \text{ Ton.} \end{aligned}$$

By this Weight are weighed, *Tin, Steel, Iron, Lead, &c.* and all Goods that are subject to Waste, as all Kinds of grocery Wares, also *Flesh, Butter, Cheese, Salt, &c.*

N. B.

46 Common Tables of Weights, Measure, &c.

N. B. It has been found by a nice Experiment that a *Pound Avoirdupois* is equal to 14 *Ounces* 11 *Pennyweight*, and 15½ *Grains Troy*, which expressed decimally is 1.215191 *Pound Troy*. Hence an *Ounce Avoirdupois* is equal to .911393 of an *Ounce Troy*, or 18 *Pennyweight*, and 5½ *Grains*, nearly.

TABLE 5. *Wool Weight.*

<i>Pounds,</i>	<i>Note, The Pound in this Weight is the same with the Pound Avoirdupois.</i>			
7 =	1 <i>Clove,</i>			
14 =	2 =	1 <i>Stone,</i>		
28 =	4 =	2 =	1 <i>Todd,</i>	
182 =	26 =	13 =	6½ =	1 <i>Wey,</i>
364 =	52 =	26 =	13 =	2 = 1 <i>Sack,</i>
4368 =	624 =	312 =	156 =	24 = 12 = 1 <i>Last.</i>

TABLE 6. *Wine Measure.*

<i>Cub. Inches,</i>	
28½ =	1 <i>Pint,</i>
231 =	8 = 1 <i>Gallon,</i>
9702 =	336 = 42 = 1 <i>Teirce,</i>
14553 =	504 = 63 = 1½ = 1 <i>Hoghead,</i>
19404 =	672 = 84 = 2 = 1⅓ = 1 <i>Punchion,</i>
29106 =	1008 = 126 = 3 = 2 = 1½ = 1 <i>Butt or Pipe,</i>
58212 =	2016 = 252 = 6 = 4 = 3 = 2 = 1 <i>Ton.</i>

By this Measure, all *Wines, Brandies, Spirits, Mead, Perry, Cyder, Vinegar, Oil and Honey, &c.* are measured.

TABLE 7. *Ale Measure.*

<i>Cub. Inches.</i>	<i>Note, 8 Gallons is also a Firkin of Soap and Herrings.</i>
35¼ =	1 <i>Pint,</i>
282 =	8 = 1 <i>Gallon,</i>
2256 =	64 = 8 = 1 <i>Firkin,</i>
4512 =	128 = 16 = 2 = 1 <i>Kilderkin,</i>
9024 =	256 = 32 = 4 = 2 = 1 <i>Barrel,</i>
13536 =	384 = 48 = 6 = 3 = 1½ = 1 <i>Hhd.</i>

TABLE

TABLE 8. *Beer Measure.*

Cub. Inches,								
35 $\frac{1}{4}$	=	1	Pint,					
282	=	8	=	1	Gallon,			
2538	=	72	=	9	=	1	Firkin,	
5076	=	144	=	18	=	2	=	1 Kild.
10152	=	288	=	36	=	4	=	2 = 1 Barrel.
15228	=	432	=	54	=	6	=	3 = 1 $\frac{1}{2}$ = 1 Hhd.
30456	=	864	=	108	=	12	=	6 = 3 = 2 = 1 But.

N. B. This Distinction or Difference betwixt *Ale* and *Beer* Measure is only used in *London*. But in all other Places of *England* the following Table of *Beer* or *Ale*, whether it be strong or small, is to be observed, according to a *Statue of Excise* made in the Year 1689.

TABLE 9. *Beer and Ale in the Country.*

Cub. Inches,

35 $\frac{1}{4}$	=	1	Pint,
282	=	8	= 1 Gall.
2397	=	68	= 8 $\frac{1}{2}$ = 1 Firkin,
4794	=	136	= 17 = 2 = 1 Kild.
9588	=	272	= 34 = 4 = 2 = 1 Barrel,
14382	=	408	= 51 = 6 = 3 = 1 $\frac{1}{2}$ = 1 Hhd.

All Beer and Ale, both in Town and Country, are measured by *Winchester* Measure.

TABLE 10. *Dry Measure.*

Cub. Inches,
 33.6 = 1 *Pint,*
 268.8 = 8 = 1 *Gall.*
 537.6 = 16 = 2 = 1 *Peck,*
 2150.4 = 64 = 8 = 4 = 1 *Bushe,*
 8601.6 = 256 = 32 = 16 = 4 = 1 *Comb,*
 17203.2 = 512 = 64 = 32 = 8 = 2 = 1 *Quarter,*
 86016. = 2560 = 320 = 160 = 40 = 10 = 5 = 1 *Wey,*
 172032. = 5120 = 640 = 320 = 80 = 20 = 10 = 2 = 1 *Last.*

• By this Measure, *Corn, Salt, Coals, Lead-Ore, Oysters, Mussels*, and other dry Goods are measured.

48 Common Tables of Weights, Measure, &c.

TABLE 11. Cloth Measure.

<i>Inches,</i>					<i>Note, All Scotch and Irish Linens are bought and sold by the Yard, but all Dutch Linens are bought by the Ell Eng. Ell Flemish, and sold by the Ell English.</i>
2 $\frac{1}{4}$	=	1	Nail,

Table 1. Shews also the Decimal of any Number of Nails, one Ell English being the Integer; thus the Decimal of 3 Nails is .15 of an Ell, and the Decimal of 3 Quar. and 3 Nails=15 Nails is .75 of an Ell.

Note, The Figures in these Tables dashed thus 6 (as the last Figures of the 1st and 2d Numbers in Table 2.) are Repetends. What Repetends are, the Manner of working them, their Use, &c. is shewn in the 10th Chap.

12	.046875
13	.050781
14	.054687
15	.058594

By the first Table on the left Hand, which shews the Decimal of Ounces, one Pound being the Integer; is seen also the Decimal of any Number of Drams, one Ounce being the Integer; for as one Ounce is .0625 of a Pound, when a Pound is the Integer, so 1 Dram is .0625 of an Ounce, an Ounce being the Integer, &c.

The 1st Table shews likewise the Decimal of any Number of Nails, one Yard being the Integer; thus the Decimal of 3 Quar. and 2 Nails=14 Nails, is .875 of a Yard.

And by it is seen also the Decimal of any Vulgar Fraction whose Denominator is either 16, 8, or 4, which Fractions frequently occur in Business; thus the Decimal of $\frac{1}{16}$ is .0625;

the Decimal of $\frac{1}{8}$ or $\frac{2}{16}$ is .125; the Decimal of $\frac{1}{4} = \frac{4}{16}$ is .25; also the Decimal of $\frac{3}{8} = \frac{6}{16}$ is .375, &c.

These

Of the Construction of the preceding Dec. Tables. 55

These *Tables* with *those* hereafter inserted in the Computation of *Exchanges*, are sufficient to answer most Purposes in regard to bringing *into* or *out* of Decimals; but as other *Tables* may be sometimes requisite, I shall next shew the Method of making any of these Kind of Decimal *Tables*, that any one may be able to furnish himself with *Tables* suitable to his respective Business or Employment, &c.

R U L E.

Divide an *Unit* by the Number of Parts of the lowest Denomination contained in the *Integer*, and the *Quotient* will be the Decimal for 1 such Part, which *Quotient* being continually *add.d* will constitute the *Table*.

For Instance, suppose a *Week* the *Integer*, and it were required to make a *Table* shewing the Decimal (I'll suppose to 4 *Places* only) of 1, 2, 3, and so on to 7 *Days*. Here the Number of Parts of the lowest Denomination contained in the *Integer* is 7; so I first divide 1 by 7, and the *Quotient* is .1428, the Decimal for 1 *Day* (to 4 *Places*) but there being a *Remainder* of 4, I set it down next the *Quotient*, (as in the following Left-hand *Table*) thus, .1428 $\frac{4}{7}$; and the *Quotient*, with the *Remainder* placed in this Manner, I shall call a *mixt Fraction*; then for the Decimal for 2 *Days*, I add .1428 $\frac{4}{7}$ to itself, or, which is the same Thing, double it. and beginning with the Numerator of the *Vulgar Fractional Part* (for so the $\frac{4}{7}$ may be called) I say twice 4 is 8, which being 1 more than the Denominator 7, I set down $\frac{1}{7}$, and carrying 1, I say twice 8 is 16, and 1 is 17; then I set down 7, and carry 1; and thus multiplying the whole by 2 gives .2857 $\frac{1}{7}$, the *mixt Fraction* for 2 *Days*; I next add this *mixt Fraction* for 2 days to the *mixt Fraction* for 1 *Day*, saying 1 and 4 is 5, then I set down $\frac{5}{7}$, and the rest being added the sum is .4285 $\frac{5}{7}$, the *mixt Fraction* for 3 *Days*; which I likewise add to the *mixt Fraction* for 1 *Day*, saying 5 and 4 is 9, which being 2 more than the Denominator 7, I set down $\frac{2}{7}$, and carrying 1, I say 1 and 5 is 6, and 8 is 14; then I set down 4, and proceeding with the other Figures as in common Addition, the Sum is .5714 $\frac{2}{7}$; and

56 *Of the Construction of the preceding Dec. Tables.*

and thus by continually adding the *mixt Fraction* for 1 Day, the *mixt Fraction* is found for every Day required.

Lastly, if the Numerator of the *Vulgar Fractional Part* be more than half the Denominator, I add 1 to the last Decimal Place, but if the Numerator be less, no Notice is taken of it, which being observed, the Decimal Table will stand compleat to 4 Places of Decimals as on the Right-hand. And in like Manner may any Decimal Table be made to any Number of Decimal Places.

CHAP.

C H A P. II.

The Use of DECIMALS in the Rules of Proportion, viz. the Rule of THREE Direct and Inverse ; and the Double Rule of THREE, or Rule of Five Numbers.

S E C T. I. *Of the Rule of THREE Direct.*

D*irect Proportion* is, when of four Numbers, the first bears the same Proportion to the second, as the third doth to the fourth :

As in these $2 : 8 :: 6 : 24.$

Consequently the greater the second Term is, in respect to the first, the greater will the fourth Term be in respect to the third.

That is, as 8 the second Term is 4 Times greater than 2 the first Term ; so is 24 the fourth Term, 4 Times greater than 6 the third Term.

Again, the less the second Term is, in respect to the first ; the less will the fourth Term be, in respect to the third :

As in these, $18 : 6 :: 12 : 4$

That is, as 6 the second Term is equal to $18 \div 3$; so is 4 the fourth Term equal to $12 \div 3$.

Whence it follows, that if four Numbers are in direct Proportion, the Product of the first and fourth Numbers will always be equal to the Product of the second and third ;

For $2 \times 24 = 8 \times 6 = 48.$

And $18 \times 4 = 6 \times 12 = 72.$

I

Hence

Hence are deduced the 3 general Rules hereafter mentioned for finding a fourth Number in Proportion to any three given Numbers ; whence it is called the *Rule of Threes*.

Before any Operation is performed in this Rule the given Numbers must be ranged in their proper Order, which is called *stating the Question* ; in order to which observe, that two of the three given Numbers imply a Supposition, the third moves the Question, and the fourth gives the Answer. This being premised, any Question may be easily stated by these Directions, viz.

1st, Let that Number which moves the Question, or to which the Demand is affixed, be the third Term ; which Number may be known by its having generally some of these Words before it, viz. *What will ; how many ; how much ; how far, &c.*

2^d, The first Term must be always of the same Kind and Denomination with the third ; and the Number sought will be always of the same Kind and Denomination with the second Term in the Supposition.

When stated agreeable to these Directions, all Questions in *Direct Proportion* may be answered by three several Rules.

Rule 1. Multiply the second and third Terms together, and divide their Product by the first, the Quotient will be the Answer required.

Rule 2. Divide the second Term by the first, then multiply the Quotient into the third Term, and their Product will be the Answer required.

Rule 3. Divide the third Term by the first, then multiply the Quotient into the second Term, and their Product will be the Answer.

In order to work Questions in this Rule *entirely* by Decimals, those of the given Numbers which consist of diverse Denominations, must be expressed decimally, by which Means the Answer will be obtained in the shortest and best Manner, provided the *first* Term be either a *whole Number*, or contains but *one or two Decimal Places* ; but if it contains many Places of Decimals, it must necessarily cause perhaps a longer Operation in Division, than if worked by whole Numbers ; in such Case therefore it is generally better to order with the first and third Terms, as I have shewn in several of the Examples in Exchanges. The following

following Examples however are wrought altogether decimally, and may suffice to shew that Decimals are frequently of great Advantage in answering Questions in the Rule of Three Direct.

As to the Manner of reducing the Parts of *Coin, Weight, &c.* that has been already fully shewn, so in most of the following Work, shall only set down the Decimal equal to the given Parts.

QUESTION I.

If a Rowl of German *Osnaburghs* of 1500 *Ells* cost 47 : 10 = *l.* 47.5. what will 4872 *Ells* cost?

Thus stated, if

<i>Ells.</i>	<i>l.</i>	<i>Ells.</i>
1500	— 47.5 —	4872
		47.5

24360
34104
19488

500 × 3 = 1500 { 5 | 00) 231420.0

3) 462.840
—————

l. s. d.
l. 154.28 = 154 : 5 : 7½,
the Answ.

Or thus,

<i>Hund. Ells.</i>	<i>l.</i>	<i>Hund. Ells.</i>
If 15	— 47.5 —	48.72
2	2	95
30	95.0	24360
		43848
		3 0) 4628.40

The Answer, *l.* 154.28 as before.
I 2

Note,

Note, The Reason of multiplying the 1st and 2d Numbers by 2, is only to shorten the Work. This Kind of Question frequently occurs in the Linen-drapery Business.

QUESTION II.

What will 153 Days Salary amount to at 70 Guineas per Annum.

	l.	s.	l.	Days,	
First 70 Guineas =	73	:	10	= 73.5, and 153 = .419178 of	
Year,	l.		Year.	a Year.	
Then, if 1 ———	73.5	———	.419178		
Multiply by			5 37	the middle Term inverted.	
			29.3425		
			1.2575		
			.2096		
			—————		
The Answer,			l.	s.	d.
	£.	30.8096	= 30	:	16 : 2½.

Note, if the Answer to a Question is found to *four Places of Decimals* it is generally sufficient.

QUESTION

QUESTION III.

How much Bank Stock will $475 : 13 : 5$ purchase at $118\frac{1}{8}$ per Cent.?

First, $118\frac{1}{8} = 118.375$, and $475 : 13 : 5 = 475.6708$,
 Then if $118.375 - 100 = 18.375$, and 475.6708
 $118.375 \times 475.6708 = 401.834 = 401 : 16 : 8$, the
 Answer.

2170
 1184
 ———
 986
 947
 ———
 39
 35
 ———
 4
 4
 ———
 .

Questions of this Kind may also be worked in the following Manner.

If

$$\begin{array}{rcl} \text{l.} & \text{l. Stock.} & \text{l.} \\ \text{If } 118\frac{1}{8} & \text{---} 100 & \text{---} 475.6708 \\ 8 & & 8 \text{ Mult.} \end{array}$$

$$\underline{947} \quad \text{Prod.} \times 100 = \underline{380536.64}$$

$$\begin{array}{r} \text{l.} \\ 947 \overline{) 380536.64} \quad 401.834 \text{ as before.} \\ \underline{3788} \end{array}$$

$$\underline{1736}$$

$$\underline{947}$$

$$\underline{7896}$$

$$\underline{7576}$$

$$\underline{3204}$$

$$\underline{2841}$$

$$\underline{3630}$$

$$\underline{3788}$$

The fame proved.

$$\begin{array}{rcl} \text{l.} & \text{s.} & \text{d.} & \text{l.} \\ 401 : 16 : 8 & = & 401.834 & \text{Stock at } 118\frac{1}{8} \text{ per Cent.} \\ \text{Multiply } 118\frac{1}{8} & & & \end{array}$$

$$\underline{3214.672}$$

$$\underline{44201.74}$$

$$100.458 = 401.834 \div 4$$

$$\underline{50.229}$$

$\frac{2}{8} - \frac{1}{8}$
 $\frac{1}{8} - \frac{1}{8}$ of that,

$\text{l.} \quad \text{s.} \quad \text{d.}$

$$\text{Prod.} \div 100 = 475.67099 = 475 : 13 : 5, \text{ the Amount of the Stock.}$$

And after this Manner may the Amount be computed of any Sum in the *Public Funds* in general.

QUEST-

QUESTION IV.

If Goods are bought to the Amount of $l. 727 : 12 : 6$,
and sold again for $l. 790 : 7 : 6$, how much is gained *per*
Cent.?

	<i>l.</i>	<i>s.</i>	<i>d.</i>	<i>l.</i>
From	790	7	6	= 790 375
Subtract	727	12	6	= 727.625
<hr/>				
Rem.	62	15	0	= 62.750 whole Gain.
<hr/>				
Then, if	<i>l.</i>	<i>l.</i>	<i>l.</i>	
	727.625	—	62.75	— 100
			100	
	<hr/>			
	727.625	6275.0	c	(Answ. 8.624 = 8 : 12 : 53,
...	58210			the Gain <i>per Cent.</i>
	<hr/>			
	4540			
	4366			
	<hr/>

	29			
	29			
	<hr/>			

QUE.

QUESTION V.

lb. oz. P.w. gr.

If a Peck Loaf should weigh 21 : 1 : 19 : 14 Troy
Weight, what must the Weight be *Avoirdupois*?

lb. oz. P.w. gr. lb.

First 21 : 1 : 19 : 14 = 21.123263, and

It was observed Page 46, that a *Pound Avoirdupois* is
equal to 1.215191 *Pound Troy*. Hence it will be

lb. Troy.	lb. Avoir.	lb. Troy.
If 1.215191	———— 1	———— 21.123263
		lb.
1.215191) 21.123263	17.3827
.....	121519	Sub. .375 = 6 oz.
	89713	
	85063	Rem. .0077 = 2 dr.
	4650	} <i>per</i> <i>Tables.</i>
	3646	
	1004	
	972	
	32	
	24	
	8	
	8	
	—	

Hence the Answer is 17 lb.
6 oz. 2 dr. *Avoirdupois*.

S E C T.

S E C T. II. Of Reciprocal Proportion, or the Rule of THREE Inverse.

Reciprocal Proportion is, when of four Numbers, the third (*viz.* that which moves the Question) bears the same Proportion to the first, as the second does to the fourth.

Therefore, the less the third Term is, in respect to the first, the greater will the fourth Term be, in respect to the second.

And, the greater the third Term is, in respect to the first, the less will the fourth Term be, in respect to the second.

The same Directions for stating the Question are to be observed here as in *Direct Proportion*, and to know whether a Question is in *Direct* or *Reciprocal Proportion*, observe this Rule, *viz.*

When the third Term is greater than the first, and requires the fourth Term to be greater than the second; or, when the third Term is less than the first, and requires the fourth Term to be less than the second, then is the Question in *Direct Proportion*: But when the third Term is greater than the first, and requires the fourth Term to be less than the second; or, when the third Term is less than the first, and requires the fourth Term to be greater than the second, then is the Question in *Reciprocal* or *Inverse Proportion*: And is performed by this general Rule.

Multiply the first and second Terms together, and divide the Product by the third Term, the Quotient will be the fourth Term, or Answer.

E X A M P L E I.

If 8 Men do a Piece of Work in 12 Days; how many Days will 16 Men require to do the same?

$$\begin{array}{r}
 \text{Men. Days. Men.} \\
 \text{If } 8 \text{ --- } 12 \text{ --- } 16 \\
 \quad \quad 8 \\
 \quad \quad \text{---} \\
 \quad 16 \overline{)96} \text{ (6 Days, the Answer.} \\
 \quad \quad 96 \\
 \quad \quad \text{---}
 \end{array}$$

Here it is plain, that the fourth Term must be less than the second, because 16 Men undoubtedly can do the same Work in less Time than 8 can; and as the third Term is greater than the first, and requires the fourth Term to be less than the second, hence the Question is in Reciprocal Proportion.

And the Reason of the Operation (and consequently of the Rule) is grounded upon this Consideration; *viz.* if 8 Men require 12 Days to do the Work, it is plain that one man would require 8 Times 12 Days = 96 Days to do the same Work; but if one Man can do it in 96 Days, most certain 16 Men can do it in one 16th Part of that Time, *i. e.* 6 Days, as before.

E X A M P L E II.

If 16 Men can do a Piece of Work in 6 Days, how many Days will 8 Men require to do the same.

$$\begin{array}{r}
 \text{Men. Days. Men.} \\
 \text{If } 16 \text{ --- } 6 \text{ --- } 8 \\
 \quad \quad 16 \\
 \quad \quad \text{---} \\
 \quad 8 \overline{)96} \\
 \quad \quad \text{---} \\
 \quad 12 \text{ Days, the Answer.}
 \end{array}$$

Here

Here it is evident, that the fourth Term must be greater than the second; because 8 Men must needs have more Time than 16 Men, to do the same Work; and as the third Term is less than the first, and requires the fourth Term to be greater than the second, it shews the Question is in Reciprocal Proportion.

For the greater Perspicuity in this Rule, I have made choice of whole Numbers in the 2 foregoing Examples.

QUESTION III.

A borrowed of his Friend *B* thirty Guineas for 6 Months, promising to do him the like Kindness at another Time. Not long after *B* desires *A* to lend him 40 *l.* the Question is, how long *B* must keep the 40 *l.* to equal his former Kindness to *A*?

First, 30 Guineas = *l.* 31.5
 l. *M.* *l.*

Then, if 31.5 — 6 — 40
 31.5

4|0)189.0

4.725 Months.

Mult. 30

21.750 Days

Answer, 4 Months and 21.75 Days.

QUESTION IV.

If a Penny White Loaf ought to weigh 6 oz. 12 dr. *Avoirdupois*, when Wheat is sold at 6 s. 6 d. per Bushel, what must it weigh when Wheat is sold at 4 s. per Bush.?

First, 6 s. 6 d. = 6 5 Shill. and 6 oz. 12 dr. = 6.75 Ounces.

$$\begin{array}{r}
 \text{Then, if } \overset{s.}{6.5} \overset{oz.}{\text{---}} \overset{s.}{6.75} \text{---} 4 \\
 \qquad \qquad \qquad 6.5 \\
 \qquad \qquad \qquad \text{---} \\
 \qquad \qquad \qquad 3375 \\
 \qquad \qquad \qquad 4050 \\
 \qquad \qquad \qquad \text{---} \\
 4) 43.875 \\
 \text{---} \text{---} \text{ oz. dr.} \\
 10.968 = 10 : 15 \\
 \text{---}
 \end{array}$$

S E C T. III. Of the Double Rule of THREE, or Rule of Five Numbers.

In this Rule of Proportion there are five Numbers given to find a sixth in Proportion, and it is generally performed by a double Position: that is, by stating and working the Question at two Operations, either in Direct or Reciprocal Proportion, according as the Question requires,

And therefore it is called the Double Rule of Three.

The *Double Rule Direct* is, when the sixth Term or Number sought, is found by two Operations, both of them in *Direct Proportion*.

EXAM.

E X A M P L E I.

If 100 *l.* gain 3 *l.* 10 *s.* in 12 Months, how much will 300 *l.* gain in 9 Months at the same Rate ?

The Question being parted into two Positions, the first will be thus;

If *l.* 100 gain *l.* 3.5 in 12 Months, how much will *l.* 300 gain in the same Time.

$$\begin{array}{r}
 \text{If} \quad \begin{array}{ccc} \textit{l.} & & \textit{l.} \\ 100 & \text{---} & 3.5 \end{array} \text{---} \begin{array}{c} \textit{l.} \\ 300 \end{array} \\
 \quad \quad \quad 300 \\
 \quad \quad \quad \text{---} \\
 \quad \quad 100 \overline{) 1050.0} \\
 \quad \quad \quad \text{---} \\
 \quad \quad \textit{£.} 10.5 \quad \text{the Interest of 300 \textit{l.} for 12} \\
 \quad \quad \quad \quad \quad \quad \text{Months.}
 \end{array}$$

Then the next stating will be ; if *l.* 300 in 12 Months gain *l.* 10.5, how much will it gain in 9 Months ?

$$\begin{array}{r}
 \text{If} \quad \begin{array}{ccc} \textit{l.} & & \textit{l.} & & \textit{M.} \\ 12 & \text{---} & 10.5 & \text{---} & 9 \end{array} \\
 \quad \quad \quad 9 \\

 \quad \quad \quad \quad \quad \textit{l.} \quad \textit{s.} \quad \textit{d.} \\
 \quad \quad \quad \quad \quad 7.875 = 7 : 17 : 6 \quad \text{the Answer} \\
 \quad \quad \quad \quad \quad \quad \quad \quad \quad \text{required.}
 \end{array}$$

The *Double Rule of Three inverse* is, when the sixth Term or Number sought is found at two Operations (as before). But one of them requires an Answer in *Reciprocal Proportion*.

E X A M-

EXAMPLE II.

If 8 Reapers have 4 *l.* 16 *s.* for 6 Days Work;
how many Reapers will earn 19 *l.* 4 *s.* in 16 Days.

The first stating in this Question will be thus ;

If *l.* 4.8 is earned by 8 Reapers in 6 Days, how many Reapers will earn *l.* 19.2 in the same Time.

Here it is plain, that there must be a greater Number of Reapers to earn *l.* 19.2 in 6 Days, than there are to earn *l.* 4.8 in the same Time, therefore this stating falls in *Direct Proportion*.

l. *R ap.* *l.*
If 4.8 — 8 — 19.2
 19.2

48) 153.6 (32 Reapers, that is, if *l.* 4.8 is
 144 earned by 8 Reapers in 6 Days;
 — *l.* 19.2 will be earned by 32
 96 Reapers in the same Time.
 96
 —
 ..

The next stating will be to find how many Reapers will earn *l.* 19.2 in 16 Days, at the same Rate: It is plain, that it will require a less Number of Men to earn *l.* 19.2 in 16 Days than in 6 Days, so that this second stating must be done by *Reciprocal Proportion*.

If

Days. Reap. Days.

If 6 — 32 — 16
6

16) 192 (12 Reapers, the Answ. required.

16

32

32

..

In like Manner any Question in the *Double Rule of Three* may be answered by two single Positions, if Care be taken in stating them right, and whether their Operation must be performed by the single Rule *Direct* or *Inverse*.

But all Questions both *Direct* and *Inverse*, where five Numbers are proposed to find a sixth, may more easily and readily be answered by two general Rules, the Numbers being first truly placed; to do which you must carefully note, that three of the given Numbers are always conditional and supposed, and that the other two move the Question.

The three conditional Terms must always be placed in this Order.

Let that Number which is the principal Cause of *Gain* or *Loss*, *Interest* or *Decrease*, *Action* or *Passion*, be put in the *first Place*; that Number which denotes the *Space of Time*, or *Distance of Place*, &c. be put in the *second Place*; and that Number which is the *Gain*, *Loss*, or *Action*, be put in the *third Place*.

This done, place the other two Terms which move the Question, underneath those of the same Name.

Then if the *Blank*, or Term sought, fall under the third Place, the Question is *Direct*, and must be performed by this Rule.

Rule 1. Multiply the three last Terms together for a Dividend, and the two first together for a Divisor; the Quotient arising from them will be the sixth Term.

But if the *Blank* or Term sought fall under the first or second

second Place, the Question is *Inverse*, and must be thus performed.

Rule 2. Multiply the first, second, and last Terms together for a Dividend, and the other two together for a Divisor; the Quotient arising from them will be the sixth Term.

To apply these Directions and Rules to the *two last Examples*.

1. If $l. 100$ gain $l. 3.5$ in 12 Months; *these three Terms are only supposed or conditional. Then comes the Question;* what will $l. 300$ gain in 9 Months.

Agreeable to the above Directions the Numbers must be placed thus.

<i>l.</i>	<i>Months.</i>	<i>l.</i>
100	12	3.5
300	9	

The *Blank* falling under the third Place, the Operation must be performed by *Rule 1*.

Thus $3.5 \times 300 \times 9 = 9450$ the Dividend
And $100 \times 12 = 1200$ the Divisor.

Then $1200) 9450 (= l. 7.875$ the Answer as before.

2. If 8 Reapers have $l. 4.8$ for 6 days work; how many Reapers will earn $l. 19.2$ in 16 Days?

The Terms being placed by the above Directions, they will stand thus.

<i>Reapers.</i>	<i>Days</i>	<i>l.</i>
8	6	4.8
	16	19.2

The

The *Blank* falling under the first Term it must be performed by *Rule 2*.

$$\text{Thus } 8 \times 6 \times 19.2 = 921.6$$

$$\text{And } 4.8 \times 16 = 76.8$$

Then 76.8)921.6(12 Reapers, the Answer as before.

768

—

1536

1536

—

QUESTION III.

If 12 Reapers earn 19*l*. 4*s*. in 16 Days, in how many Days will 8 Reapers earn 4*l*. 16*s*.

These Numbers will stand thus,

Reapers.	Days.	<i>l</i> .
12	16	19.2
8		4.8

Here the *Blank* falls under the second Place ; therefore it must be done by *Rule 2*.

$$\text{Thus } 12 \times 16 \times 4.8 = 921.6$$

$$\text{And } 19.2 \times 8 = 153.6$$

Then 153.6)921.6(6 Days the Answer.

9216

—

....

QUESTION IV.

If the Carriage of 5C. 3qrs. 150 Miles, cost 3*l.* 7*s.* 4*d.*
 what must be paid for the Carriage of 7C. 2qrs. 25*lb.*
 64 Miles, at the same Rate?

Here the numbers will stand thus,

<i>C.</i>	<i>Miles</i>	<i>l.</i>
5.75	150	3.366666
7.7232	64	

Multiply by 3.366666
 2327.7 the fourth Number invert.

C H A P. III.

Decimal Practice; or a Short way of computing
all kind of Merchandize by DECIMALS.

The common Method of working Practice by taking *Aliquot Parts* for broken Quantities, makes it very difficult; but such is the great Utility of Decimals in this Rule, that the trouble of taking *such Parts* is avoided, and thereby the most difficult Rule in common Arithmetic (when done the usual way) is rendered very easy, and instead of many Tables of Aliquot Parts, which the common Method requires; here, only the following one (of Money) will be sufficient, which I would advise the Learner to be very Perfect in.

s.	d.	Parts
10	:	---
6	:	8
5	:	---
4	:	---
3	:	4
2	:	6
2	:	---
1	:	8
1	:	---
-	:	8
-	:	6
-	:	4
-	:	3
-	:	2

The *even* or *Aliquot Parts* of a Pound Sterling. Dividing by which gives the Answer in Pounds.

CASE I.

When the given Price of a *Pound, Yard, Piece, &c.* is less than a *Shilling*, the Answer is found by the Directions in the following *Table*, which shews the respective *Divisors*, by which any *Quantity* is to be divided, &c.

The TABLE.

Price	Divisors.	Price	Divisors.	Price	Divisors.

An Explanation of the preceding Table.

Seek in the Columns under the word *Price* for the given Price of any Commodity, against which you will find the Divisors by which any given Quantity is to be divided for the Answer in Pounds, thus against 3*d.* you find 3*d.* - $\frac{1}{80}$ of *l.* so that when the Price is 3*d.* any given Quantity being divided by 80, the Quotient is the Answer.

Where this Character — is prefixed (as in the second Line against 1*½d.*) it signifies that the Answer is found by *Subtracting* the last Quotient from the first. See the third Example following.

Where this Character + is prefixed (as in the second Line against 2*d.*) it denotes the respective Quotients to be *added*. See the fourth Example.

Where no Character is prefixed, the *last Quotient* is the Answer, as in the 1st and 2nd Examples.

The *Reason* of dividing as directed in the Table is plain by the Table itself; for Instance, suppose the amount of any Quantity were required at 4*½d.* *per Yard* or *per Piece*, &c. the Table directs you first to divide the given Quantity by 80, because 3*d.* is the eightieth part of a Pound; and then you are to divide that Quotient by 2, because 1*½d.* is the half of 3*d.* consequently the Sum of the Quotients will be the Answer.

But the following Examples will illustrate the whole, and more fully shew the Reason of the Directions prescribed in the Table; and the Reasons of the Operations being known, the Learner may then be able (with a little practice) to work any Question himself without the help of the Table, which indeed is the principal Thing to be aimed at; for a Man would not be very fit to transact Business, that, to do a Sum in Practice, was under the necessity of applying to a Table for Directions: the Design therefore of the Table is chiefly to initiate the Learner in the Rule, and at the same time shew him the shortest way of performing any Operation in this Case.

Note, The Quotients in the following Operations are always placed in a Line with the Divisors, and may be continued only to *four* Decimal Places.

Exam. 1. 3600 Yards at $\frac{1}{4}$ per Yard.

$$\begin{array}{r} d. \\ 3 \text{ is } \frac{1}{80} \text{ of a } l. \quad 45.0 = 3600 \div 80 \end{array}$$

$$\frac{1}{4} \text{ is } \frac{1}{12} \text{ of that} \quad 3.75 = 45 \div 12$$

Hence the Answer is 3*l.* 15*s.*

Exam. 2. 504 Yards at $1\frac{1}{4}$ *d.* per Yard.

$$\begin{array}{r} s. \quad d. \\ 2 : 6 - \frac{1}{8} \text{ of a } l. \quad 63 \end{array}$$

		<hr/>
Sum, the Answer,		$47.8169 = 47 : 16 : 4$

C A S E II.

When the Price is *any Number of Shillings*, the Answer may be found much the same as in the last Case, by taking *aliquot Parts* of a Pound, but a more general Rule is to turn the Shillings into the *Decimal* of a Pound, and multiply the given Quantity by such Decimal, which is often the shortest Way, especially when the Price is an *even* Number of Shillings.

Gallons. s.

Ex. 1. $674\frac{1}{2} = 674.5$ at 6 per Gallon.

Multiply by .3 the Decimal of 6 Shill.

Answer, $202.35 = 202\text{ l. } 7\text{ s.}$

M

Examp.

$$\text{Examp. 2. } 725\frac{2}{5} = 725.4 \text{ at } 14 \text{ (} = .7 \text{)}$$

$$\text{Answer, } \begin{array}{r} \text{.7} \\ \hline \text{507.78} = 507 : 15 : 7\frac{1}{4} \end{array}$$

If the Price is at so much *per* 100, divide the Product by 100, or if at so much *per* 1000, divide by 1000.

$$\text{Examp. 3. } 37216 \text{ at } 5 \text{ (} = .25 \text{) per 100}$$

$$\begin{array}{r} \text{.25} \\ \hline 186080 \\ 74432 \\ \hline \end{array} \quad \begin{array}{r} \text{l.} \quad \text{s.} \quad \text{d.} \\ \hline \end{array}$$

$$\text{Prod.} \div 100 = 93.0400 = 93 : \text{—} : 9\frac{1}{2}$$

The last Example proved by taking the *Aliquot Part* of a Pound.

$$\begin{array}{r} 372.16 \text{ at } 5 \text{ s. per 100} \\ \hline \text{s.} \\ 5 - \frac{1}{4} \text{ of a l. } 93.04 \text{ the Answer as before.} \\ \hline \end{array}$$

$$\text{Examp 4. } 53176 \text{ at } 17 \text{ (} = .85 \text{) per 1000}$$

$$\begin{array}{r} \text{.85} \\ \hline 265880 \\ 425408 \\ \hline \end{array} \quad \begin{array}{r} \text{l.} \quad \text{s.} \\ \hline \end{array}$$

$$\text{Prod.} \div 1000 = 45.19960 = 45 : 4, \text{ nearly.}$$

The same proved.

The Examples in this Case (or indeed any Sums in Practice) may also be done without taking any Aliquot Parts at all, that is by multiplying the Quantity by the *whole* of the given Price, both Shillings and Pence, (and Farthings if any) being expressed decimally, but the Methods already taught will generally be found shorter than that I am now speaking of, especially if the Operations on both sides are performed without Decimal Tables, but that the Reader may see all the Methods of Decimal Practice, I shall here work the last Example wholly by Multiplication.

C H A P. IV.

The Use of DECIMALS, in Tare and Trett.

Gross Weight, is the Weight of a Commodity, including the Weight of the *Cask*, *Chest*, &c. wherein the Goods are contained.

Tare, is an allowance for the Weight of the *Cask*, *Chest*, &c. and is uncertain according to the Package of Goods.

Trett, is an allowance for the *Waste*, *Dirt*, &c. that is in any Goods, and is always 4lb in 104.

When the *Tare* is subtracted from the *Gross Weight*, if no *Trett* is allowed, the Remainder is called *Neat Weight*.

But if both *Tare* and *Trett* are allowed, the *Tare* being subtracted, the Remainder is called *Suttle*, from which the *Trett* being taken, the Remainder is *Neat Weight*.

There are many ways of solving Questions in this Rule, but I think the best way of finding the *Tare*, is to work by Aliquot Parts, provided the Practitioner be ready in those which follow, *viz.*

$$\begin{array}{rcl}
 \text{lb} & & \text{lb} & & \text{lb} \\
 16 \text{ is } \frac{1}{7} \} & \text{of a C. wt.} & 8 \text{ is } \frac{1}{7} \} & 2 \text{ qrs.} & 7 \text{ is } \frac{1}{4} \} & \text{of 1 qr.} \\
 14 - \frac{1}{8} \} & & 7 - \frac{1}{8} \} & & 4 - \frac{1}{7} \} &
 \end{array}$$

Note, In this Rule, *three Places* of Decimals are generally sufficient for the odd Weight.

Ex. I. What's the *Neat Weight* of 256C. 2qrs. 19lb.
Tare 14lb. per C.

$$\begin{array}{rcl}
 \text{lb} & & \\
 256.669 & \text{the Gross wt.} & \\
 14 - \frac{1}{8} \text{C} & 32.083 & \text{the Tare, which Subtract} \\
 \hline
 \text{Remains} & 224.586 & = 224\text{C. } 2\text{qrs. } 9\text{lb. the Neat wt.}
 \end{array}$$

N 2

EXAMPLE

2 *The Use of Decimals in Tare and Trett.*

Ex. 2. What's the *Neat* Wt. of 74 : 3 : 12. *Tare* 18
per C

	74.857	The <i>Gross</i> wt.
£	<hr/>	
16 - $\frac{1}{7}$ C.	10.694	} Add
2 - $\frac{1}{8}$ of that	1.336	
	<hr/>	
Subtract	11.030	the <i>Tare</i>
	<hr/>	
Remains	63.827	= 63C. 3qrs. 8£. <i>Neat</i> wt.

Ex. 3. What's the *Neat* Wt. of 348 : 3 : 24, *Tare* 17
per C.

	384.964	The <i>Gross</i> Wt.
£.	<hr/>	
14 - $\frac{1}{8}$ of C.	48.120	} Add
2 - $\frac{1}{7}$ of that	6.874	
1 - $\frac{1}{2}$ of that	3.437	
	<hr/>	
Sub.	58.431	the <i>Tare</i>
	<hr/>	
Remains	326.533	= 326 : 2 : 3 <i>Neat</i> wt.

Ex. 4. What's the *Neat* Wt. of 548 : 2 : 23, *Tare* 15
per C.

	548.705	the <i>Gross</i> wt.
qrs.	<hr/>	
2 - $\frac{1}{2}$ of C.	274.357	} Add
£	<hr/>	
8 - $\frac{1}{7}$ of 2	39.194	
7 - $\frac{1}{8}$ of 2	34.294	
	<hr/>	
Sub.	73.488	the <i>Tare</i>
	<hr/>	
Remains	475.217	= 475C. and 24£. <i>Neat</i> wt.

The Reason of beginning this Example with 2qrs.
is the $\frac{1}{2}$ of C. is for the more easy taking parts for the 15£.
Anothe

Another Method of finding the Neat weight when only *Tare* is allowed, is to multiply the *Gross* Weight by the *Decimal* of the *Neat* Weight of a Hundred.

Example What's the *Neat* Wt. of 256 : 2 : 19 *Tare* 14lb. per C.

	grs. lb.		
From	4 :	then mult	256.669 <i>Gross</i> wt.
Subtr.	- : 14	by	578.0 the <i>Neat</i>
			of 100. inv.
Rem.	3 : 14 = .875	205 335	
	the <i>Neat</i> of 1 C.	17.967	
		1.283	
		Prod.	224.58; the <i>Neat</i>

Weight as before in *Example* 1.

Thus much for finding the *Neat* Weight when *Tare* only is allowed, the next thing is to find the *Neat* when there is an allowance of both *Tare* and *Trett*.

It has been before observed that the allowance for *Trett* is always 4lb. in 104, which is 1lb. in 26 : So that the *Tare* being subtracted from the *Gross* wt and the Remainder (called *Suttle*) divided by 26, the Quotient is the *Trett*, which subtracted from the *Suttle*, gives the *Neat* weight.

EXAM-

Example 5. What's the *Net Wt.* of $\overset{\text{C}}{375} : \overset{\text{qr.}}{1} : \overset{\text{lb.}}{15}$,
Tare 13^{lb.} per C. and *Trett* 4^{lb.} per 104?

	375.384	<i>Gross</i>
2 - - $\frac{1}{2}$ of C. --	187.692	
8 - - $\frac{1}{4}$ of that	26.813	} add
4 - - $\frac{1}{8}$ of that	13.407	
1 - - $\frac{1}{16}$ of that	3.351	
Subtract the Sum	43.570	<i>the Tare</i>
Remains --	331.814	<i>Suttle</i>
from which Sub.	12.762	<i>the Trett, found as below.</i>
Remains. --	319.052	= 319C. and 6 ^{lb.} nearly,

the Net Wt.

<i>Suttle</i>	<i>Trett</i>
26)331.814(12.762
26	26
71	76572
52	25524
198	2
182	331.814
161	
156	
54	
52	
2	

The Use of Decimals in Tare and Trett. 95

The *Suttle* in the foregoing Example may also be found in the same manner as the *Neat Weight* in the Example preceding it, thus

qrs.	lb.	
from 4 :		then mult. 375.384 Grofs
Subtr. - : 13		by 9.9388.0 the <i>Sut.</i> of 1C. inv.
Rem. 3 : 15 =	883929	300.307
the <i>Suttle</i> of 1C,		30.031
		1.126
		.338
		8
		3

	Product	331.813 the <i>Suttle</i> as before

This Method may serve as a Proof to the other in regard to the *Suttle*, and the best way of proving the *Trett* is to multiply it by 26, as in the Work.

C. qrs. lb.

Example 6. In 57 Butts Currants weighing 732 : 1 : 11 Grofs, Tare 19^{lb.} per Butt, and Trett 4 per 104; how many C. *Neat*?

	57. Butts, Tare at 19 ^{lb.}	
lb.	---	
16 - $\frac{1}{7}$ of C.	8.143	
2 - - $\frac{1}{8}$ of that	1.018	
1 - - $\frac{1}{2}$ of that	0.509	

Tare	9.670	which subtract
from 732.348		Grofs wt.

Remains	722.678	<i>Suttle</i> which divide by 26 and
Sub. the Quo.	27.795	<i>Trett</i>

Remains	694.883 = 694C. 3qrs. 15 ^{lb.} <i>Neat</i> .	

C H A P. V.

The Use of DECIMALS in the Rules of Fellowship.

By the *Rules of Fellowship*, the Accounts of several Partners trading in a Company, are so adjusted or made up, that every Partner may have his just Part of the Gain, or sustain his just Part of the Loss; according to the Proportion or Share of Money he hath in the *Joint-Stock*.

Seet. 1. The Single Rule of Fellowship; or that without Time.

By the *Single Rule of Fellowship* is adjusted the Accounts of those Partners, that put all their several and perhaps different Sums of Money, into a common Stock at one and the same Time; and all Questions of this Nature are answered by so many several Operations in the *Rule of Three Direct*, as there are Partners in the Stock: For *as the whole Stock, is to the whole Gain or Loss; so is each Man's particular Share, to his particular Share of the Gain or Loss.*

Example. Suppose 3 Partners, A, B, and C, make a *Joint Stock* in this manner,

	<i>l.</i>	<i>s.</i>	<i>d.</i>		<i>l.</i>
A puts in	325	: 7	: 6	=	325.375
B———	217	: 5	: -	=	217.25
C———	175	: 17	: 6	=	175.875

the whole Stock	718	: 10	: -	=	718.500
					<i>l. s. d.</i>

With this Stock they trade and gain 125 : 12 : 10 = 125.6416 *l.* it is required to find each Man's Share or Part of the Gain.

For

For the respective Shares, say,

	<i>l.</i>	<i>l.</i>		<i>l.</i>	<i>l.</i>
As	718.5	:	125.6416	$\left\{ \begin{array}{l} :: 325.375 : 56.897 \text{ A's Share} \\ :: 217.25 : 37.9896 \text{ B's Share} \\ :: 175.875 : 30.7546 \text{ C's Share} \end{array} \right.$	

The Sum of the several Shares 125 6412

Which being the same with, or equal to, the *whole Gain*, always proves the *Truth* of the Work.

But as the first and second Terms are common to every Proportion in *this* and in all Cases in the Rules of Fellowship, therefore any Question may be soonest answered by the 2d Rule Page 58 namely, by dividing the second Term by the first, which will give the *Gain* or *Loss* of one Pound; and then by *that* to multiply each man's particular Share of the Stock, the several *Products* will be each man's Share of the Gain or Loss.

l. *l.* *l.* *l.*

Thus, as 718.5 : 125.6416 :: 1 : .174866 the common Multiplier.

A's part of Stock	325.375	B's part of Stock	217.250
Multiplier invert.	668471.0	Mult. inverted.	668471.0

11

Here every man's Share is as before.

C's Part of Gain	30.7546
	0

Set.

Seet. 2. Double Fellowship, or That with Time.

Fellowship with Time considers the *Share* of the *Gain* or *Loss* with regard to the *Money*, and the *Time* it was employed, and proportionates it to *both* by the following

R U L E.

Multiply each Man's Stock by the Time it was employed; then say, as the Sum of those Products, is to the whole Gain or Loss; so is every one of the Products, to its proportional Part of the Gain or Loss.

Example. Four Merchants A, B, C, and D, enter into Partnership thus,

	<i>l.</i>	<i>s.</i>	
A put in	64	: 10	for $4\frac{1}{2}$
B ———	78	: 15	— 6
C ———	112	: 14	— $8\frac{1}{2}$
D ———	125	: 5	— $5\frac{1}{4}$

} Months

They traffick and Gain 108 *l.* 18 *s.* $4\frac{1}{2}$ *d.* = 108.91875 *l.*
It is required to find every Man's Share of the Gain, according to the Stock and Time it was employed.

	<i>l.</i>	<i>Months</i>	<i>Products</i>
First { A's Stock	64.5	× 4.5	= 290.25
{ B's Stock	78.75	× 6.	= 472.5
{ C's Stock	112.7	× 8.75	= 986.125
{ D's Stock	125.25	× 5.25	= 657.5625

The Sum of the Products. 2406.4375

Then, as

	<i>l.</i>	
2406.4375 : 108.91875	{	$\begin{aligned} &:: 290.25 : 13.137 \text{ for A} \\ &:: 472.5 : 21.3859 \text{ for B} \\ &:: 986.125 : 44.633 \text{ for C} \\ &:: 657.5625 : 29.762 \text{ for D} \end{aligned}$

The whole Gain nearly 108.9179

5

To

The Use of Decimals in Fellowship. 99

To work this by the shorter Method of finding the proportional Part of the Gain due to one Pound, it will be,

As 2406.4375 : 108 91875 :: 1 : .045261 the common Multiplier, then the Operations will be as follow :

$$\begin{array}{r}
 290.250 \\
 \text{Multiplier invert. } 162540.0 \\
 \hline
 11.6100 \\
 1.4513 \\
 580 \\
 174 \\
 3 \\
 \hline
 \end{array}$$

A's Gain 13.1370

$$\begin{array}{r}
 986.125 \\
 162540.0 \\
 \hline
 39.4450 \\
 4.9306 \\

 7 \\
 \hline
 \end{array}$$

D's Gain 29.7620

Their several Shares as before.

C H A P. VI.

The Use of DECIMALS in Barter.

BARTER is the exchanging of one *Commodity* for another, and informs Merchants so to proportion their *Quantities*, as that neither may sustain *Loss*.

The Method of resolving any Question herein depends wholly upon a clear Understanding of the *Rule of Three Direct* and *Inverse*.

QUESTION I.

How many Hundred of Hops at 5 *l.* 15 *s.* per Hundred, must be given in Barter for 18 C. 3 *qrs.* 21 *lb.* of Cheese at 1 *l.* 12 *s.* per C?

$$\begin{array}{r}
 \begin{array}{ccc}
 l. & C. & l. \\
 \text{If } 1.6 & \text{---} & 18.9375 \text{---} & 5.75 \\
 & & .4 \times 4 = 1.6 \\
 \hline
 & & 7.57500 \\
 & & 4 \\
 \hline
 & & 30.300
 \end{array} \\
 5.75 \overline{) 30.300} & (5.27 = 5 : 1 : 2 \text{ Answer.} \\
 \underline{2875} & \\
 1550 & \\
 \underline{1150} & \\
 4000 & \\
 \underline{4025} &
 \end{array}$$

This (or any Question of the like Kind) may be proved, by finding the true Value of that Commodity whose Quantity is given, (which here is Cheese) and then find how much of the other Commodity will amount to that Sum at the Rate proposed.

Q U E S.

QUESTION II.

How many Gallons of Brandy at 5 s. 6 d. per Gallon, shall I have in Barter for 15 Hund. Hops at 4 l. 15 s. per C. ?

$$\begin{array}{r}
 \text{l.} \quad \text{s.} \quad \text{s.} \quad 5) \text{C.} \quad 5) \text{s.} \\
 4 : 15 = 95 \text{ --- } 15 \text{ --- } 5.5 \\
 \quad \quad \quad 3 \quad \quad \quad \text{---} \quad \quad \quad \text{---} \\
 \quad \quad \quad \text{---} \quad \quad \quad 3 \quad \quad \quad 1.1 \\
 1.1)285.0
 \end{array}$$

259.09 Gallons, the Answer.

Note, The Reason of dividing the second and third Numbers by 5 is only to shorten the Work ; for the *first* and *third*, or *second* and *third* Numbers, in the *Rule of Three Inverse*, may at any Time be divided by any Number that will divide both without a Remainder. So also in the *Rule of Three Direct*, the *first* and *second*, or *first* and *third* Numbers, may be divided by any Number that will divide them, leaving no Remainder.

QUESTION III.

Two Merchants, *A* and *B*, barter ; *A* would exchange 5 C. 3 qrs. 14 lb. of Pepper, which is worth 3 l. 10 s. per C. with *B* for Cotton worth 10 d. per Pound. How much Cotton must *B* give *A* for his Pepper ?

$$\begin{array}{r}
 \text{l.} \quad \text{d.} \quad \text{C.} \quad \text{d.} \\
 \text{If } 3 : 10 \text{ --- } 5.875 \text{ --- } 10 \\
 \quad \quad \quad 20 \quad \quad \quad 840 \\
 \text{---} \quad \quad \quad \text{---} \\
 \quad \quad \quad 70 \quad \quad \quad 235000 \\
 \quad \quad \quad 12 \quad \quad \quad 47000 \\
 \text{---} \quad \quad \quad \text{---} \\
 \quad \quad \quad 840 \quad \quad \quad \text{---}
 \end{array}$$

The Product $\div 10 = 493.5000$ the Answer in Pounds
 which divide by 112)448 (= 4 C. 1 qr. 17½ lb.

lb. 45½

Q U E S -

QUESTION IV.

Two Merchants, *A* and *B*, barter thus ; *A* hath 86 Yards of Broad Cloth worth 9 s. 2 d. *per* Yard ready Money ; but in Barter he will have 11 s. *per* Yard. *B* hath Shalloon worth 2 s. 1 d. ready Money ; it is required to find how many Yards of the Shalloon *B* must give to *A* for his Cloth, to make his Gain in the Barter equal to that of *A*'s.

In solving this Question, the advanced Price of *B*'s Shalloon must first be found.

$$\begin{array}{rcl}
 \text{Thus, if} & \begin{array}{c} s. \quad d. \\ 9 : 2 \end{array} & \begin{array}{c} s. \\ 11 \end{array} \\
 & \begin{array}{c} \hline 12 \\ \hline \end{array} & \begin{array}{c} \hline 25 \\ \hline \end{array} \\
 & 110 & - \quad - \quad) 275 \\
 & & \hline
 \end{array}$$

2.5 s. the advanced Price of *B*'s Shalloon.

$$\begin{array}{rcl}
 \text{Then, if} & \begin{array}{c} s. \\ 11 \end{array} & \begin{array}{c} Yards. \\ 86 \end{array} \\
 & \hline & 11
 \end{array}$$

$$.5 \times 5 = 2.5 \left\{ \begin{array}{l} .5) 946.0 \\ \hline 5) 1892. \end{array} \right.$$

378 4 Yards, the Answer.

QUESTION V.

A has 52 Dozen of Hats, worth in ready Money 2 s. 6 d. but barter at 2 s. 9 d. *per* Hat ; *B* has Cotton at 10 d. *per* lb. ready Money. *Query*, how much Cotton must *B* give for the Hats, to make his Gain in the Barter equal to *A*'s ?

First,

C H A P. VII.

The Use of DECIMALS in INTEREST both SIMPLE and COMPOUND; including Commission and Brokerage, Rebate or Discount, Equation of Payments, and purchasing of Freehold Estates.

INTEREST, is a small Sum of Money paid for the Use of any greater Sum, according to any Rate agreed on, as 5 *l.* per 100 *l.* &c. for a Year, and it is either *Simple* or *Compound*.

S E C T. I. *Of Simple INTEREST, with the Computation of Commission, Brokerage, and Insurance.*

Simple Interest is that which arises only from the *Principal* or *Sum of Money* lent, and therefore, tho' it be forborn any Number of Years, the *Interest* for each Year is the same, and the *Principal* continues as at first.

C A S E I.

The *Principal*, *Rate of Interest*, and *Time* being given to find the *Interest*.

1. When the *Interest* of any Sum is required for 1 Year, it may be found by the *Rule of Three Direct*; thus suppose the *Interest* of 500 *l.* were required for 1 Year at 5 *l.* per Cent. *per An.* it would be, as 100 *l.* is to 5 *l.* (the *Rate of Interest*) so is 500 *l.* (the *Principal*) to 25 *l.* the *Interest* thereof for 1 Year. Hence we have this *general Rule* for finding the *Interest* of any Sum for a Year; namely, to multiply the *Principal* by the *Rate of Interest*, and divide the *Prod.* by 100.

If

If the *Rate* of Interest is *Pounds*, and any *Part* of a *Pound*, as $3\frac{1}{2}$, $4\frac{1}{2}$, or $4\frac{3}{4}$ *per Cent.* multiply the *Principal* by the *Pounds*, and for a $\frac{1}{2}$, take a *fourth* Part of the *Principal*; for $\frac{1}{4}$, take *Half* the *Principal*; for $\frac{3}{4}$ take Parts compounded of $\frac{3}{4}$, which add to the *Product* of the *Principal* multiplied by the *Pounds*, the *Sum* divided by 100, as above directed, will be the *Interest* required.

Another *Way* of finding the *Interest* for a *Year*, is to take *Equal Parts* of 100 *l.* &c. for the given *Rate*, let the *Rate per Cent.* be what it will.

2. If the *Interest* of any *Sum* is required for *several Years*, multiply the *Interest* for 1 *Year* by the *Number* of *Years* given.

3. If besides *Years*, the *Interest* is required for $\frac{1}{2}$, $\frac{1}{4}$, or $\frac{3}{4}$ of a *Year*, take Parts for the said $\frac{1}{2}$, $\frac{1}{4}$, or $\frac{3}{4}$ from the *Interest* for 1 *Year*, and add them to the *Interest* for the rest of the *Time*; the *Sum* will be the *Interest* required.

4. If the *Interest* is required for any *Number* of *Months*, take Parts for the *Months* from the *Interest* for 1 *Year*.

5. If the *Interest* of any *Sum* be required for any *Number* of *Days*, multiply the *Interest* for 1 *Year* by the *Decimal* of the given *Days*.

6. If the *Interest* is required for *Years* and *Days*, multiply the *Interest* for 1 *Year*, by the *Number* of *Years* given, and the *Decimal* of the *Days*.

Note. If there be any *Shillings* and *Pence* in the *Sum* whose *Interest* is required, and the *Time* not exceeding a *Year*, it will be sufficiently exact to express the *Decimal* of them, to two *Places* only, and this may be readily done without applying to the *Decimal Table* of *Money*; for the *Decimal* of the *Shillings* is known by taking half of them, as was observed in *Reduction*; and as for the *Pence*, bring them into *Farthings*, and for every ten *Farthings* add 1 to the *second Decimal Place* of the *Shillings*; thus to find the *Decimal* of 15 *s.* 8 *d.* to two *Decimal Places*.

To .75 the *Decimal* of 15 *Shillings*.

Add .3 the *Number* of *Tens* in 32 *Farthings*.

Sum, .78 the *Decimal* required. And

If instead of the *Tens*, the whole *Number* of *Farthings* were set down, adding 1 *Farthing* if above 13, and 2 if
P above

above 38, the Sum would be the Decimal to *three Places*, thus,

To .75 as before.
Add 33 the Farthings in 8 Pence, more 1,

Sum, .783 the Decimal of 15 s. 8 d. to *three Places*; and three Places of Decimals are generally sufficient when the Interest is required for Years.

E X A M P L E I.

What's the simple Int. of 75 l. 13 s. 6 d. for 1 Year, at 5 per Cent.?

Mult. 75.67 the Principal
by 5 the Rate of Int.

The Prod. $\div 100 = 3.7835 = 3$ l. 15 s. 8 d. the Int. required.

Or thus,

l. 75.67
5 - $\frac{1}{20}$ of 100 l. 3.7835 the Int. as before.

E X A M P L E II.

What's the Interest of 127 l. 10 s. 5 d. for 1 Year at $3\frac{1}{2}$ per Cent.?

127.52 at $3\frac{1}{2}$ per Cent.

3

382.56

$\frac{1}{2}$ - - - 63.76 = Prin. $\div 2$

The Sum $\div 100 = 4.4632 = 4$ l. 9 s. 3 d. the Int. required.
Or

Or thus, by taking *Aliquot Parts*.

<i>l.</i>	<i>l.</i>	127.52 at 3 $\frac{1}{2}$
2 $\frac{1}{2}$ - $\frac{1}{40}$ of 100		3.188 the Prin. \div 40
1 - $\frac{1}{100}$		1.2752 Prin. \div 100
		<hr style="width: 100px; margin: 0 auto;"/>
		Sum, <i>l.</i> 4.4632 the Int. as before.

Besides the two foregoing Methods, I shall next shew a short Way of my own for finding the Interest of any Sum for a Year, if the Rate be 1 $\frac{1}{2}$, 2 $\frac{1}{2}$, 3 $\frac{1}{2}$, or 4 $\frac{1}{2}$ per Cent.

First find the Interest at 5 per Cent. (as in Ex.1.) which multiply by as many *Tenths* as there are *Half-Pounds* in the given Rate; that is, if the Rate be 3 $\frac{1}{2}$, multiply by .7; if 4 $\frac{1}{2}$, multiply by .9, &c. the *Product* will be the *Interest* sought. For Instance, let the Interest be again required of 127 *l.* 10 *s.* 5 *d.* for 1 Year at 3 $\frac{1}{2}$ per Cent.

127.52	
5	
<hr style="width: 100px; margin: 0 auto;"/>	
6.3760	the Int. at 5 per Cent.
.7	
<hr style="width: 100px; margin: 0 auto;"/>	
<i>l.</i> 4.46320	the Int. at 3 $\frac{1}{2}$ per Cent.

EXAMPLE III.

What will Half a Year's *Dividend* on 2467 *l.* *South Sea Annuities* come to at 1 $\frac{3}{4}$ per Cent.?

This is nothing more than finding the Interest of 2467 *l.* for 1 Year at 1 $\frac{3}{4}$ per Cent.

2467
1233.5
616.75

The Sum \div 100 = 43.1725 = 43 *l.* 3 *s.* 5 $\frac{1}{4}$ *d.* the Answ.

P 2

Or

Or thus,

$$2467 \div 100 = 24.67 \text{ the Int. at 1 per Cent.}$$

Multiply 7 the Quarters in $1\frac{1}{4}$

$$\text{Divide by } 4 \overline{)172.69}$$

$$\underline{\underline{43.1725}} \text{ the Answ. as before.}$$

E X A M P L E IV.

What's the Interest of 257 *l.* 8 *s.* 7 *d.* for 5 Years at 4 per Cent.

$$\begin{array}{r} 257.429 \\ 4 \end{array}$$

$$\underline{\underline{10.29716}} \text{ the Int. for 1 Year.}$$

$$\begin{array}{r} 5 \\ \hline \end{array} \begin{array}{l} \textit{l.} \quad \textit{s.} \quad \textit{d.} \\ 51.48580 = 51 : 9 : 8\frac{1}{2}, \text{ the Int. required.} \end{array}$$

Or thus,

First, $4 \times 5 = 20$ the *Rate per Cent.* multiplied by the *Time*,
then multiply 257.429 the *Prin.*
by 20

$$\text{The Product } \div 100 = \underline{\underline{51.48580}} \text{ the Int. as before.}$$

E X A M-

E X A M P L E V.

What's the Interest of 426 *l.* 5 *s.* 9 *d.* for 6 $\frac{1}{4}$ Years, at 4 $\frac{1}{2}$ per Cent.?

$$\begin{array}{r}
 426.287 \text{ at } 4\frac{1}{2} \text{ per Cent.} \\
 \underline{4} \\
 1705.148 \\
 \frac{1}{2} - \quad 213.143 \\
 \hline

EXAMPLE VIII.

What will 3628 *l.* 14 *s.* 9 *d.* amount to in 3 $\frac{1}{4}$ Years and 54 Days, at 3 *per Cent.*?

Note, The *Amount* is the Principal and Interest added together.

$ \begin{array}{r} 3628.737 \\ \underline{3} \\ 108.86211 \text{ Int. for 1 Year.} \\ \text{Mult. } 549793.3 \text{ the Time invert.} \\ \hline 326.5863 \\ 32.6586 \\ 9.7976 \\ .7620 \\ 980 \\ 43 \\ 5 \\ \hline \text{Prod. } 369.9073 \text{ Interest} = 369 \text{ } l. \text{ } 18 \text{ } s. \text{ } 1\frac{1}{4} \text{ } d. \\ \text{Add, } 3628.7375 \text{ Principal.} \\ \hline \text{Sum, } 3998.6448 \text{ Amount} = 3998 \text{ } l. \text{ } 12 \text{ } s. \text{ } 10\frac{1}{4} \text{ } d. \end{array} $	$ \begin{array}{r} \frac{1}{4} \text{ Year} = .25 \\ 54 \text{ Days} = .147945 \\ \hline 3.397945 = 3\frac{1}{4} \\ \hline \text{Years} \\ \text{and } 54 \text{ Days.} \end{array} $ <p style="margin-top: 20px;">To find the Interest of a Sum for Years and Days <i>without a Decimal Table</i>, multiply the Interest for 1 Year by the Years given, and proceed with the Days as directed in the last Example.</p>
---	---

Of Commission and Brokerage.

Commission is an Allowance from *Merchants* to their *Factors* or *Agents* beyond Sea, in the buying or selling of any Sort of Goods, and is a certain *Rate per Cent.* according to the Custom of the Country where the Factor resides.

Brokerage, is an Allowance to Persons called *Brokers*, at a certain *Rate per Cent.* for finding Customers, and selling to them the Goods of other Men, whether Strangers or Natives.

The *Commission* and *Brokerage*, and also *Insurance* on any Sum is computed in the same Manner as the simple Interest thereof for a Year.

I. An Example in Commission.

Suppose my Factor sells Goods on my Account to the Amount of 127 l. 10 s. 5 d. what does his Commission come to at $3\frac{1}{2}$ per Cent. ? Answer, 4 l. 9 s. 3 d. For the Operation, see the 2d Example in Interest.

II. Examples in Brokerage.

Ex. 1. What's the Brokerage of 723 l. 10 s. 6 d. at $\frac{1}{4}$ per Cent. ?

$$\begin{array}{r} \frac{1}{4})723.525 \\ \hline \end{array} \quad \begin{array}{l} s. \quad d. \end{array}$$

The Quot. $\div 100 = .9044 = 18 : 1$ the Brokerage requir.

Ex. 2. What's the Brokerage of 2572 l. 15 s. at $\frac{3}{8}$ per Cent. ?

$$\begin{array}{r} 2572.75 \\ \hline \frac{3}{8} \text{ is } \frac{1}{4} \\ - \frac{1}{2} \text{ of that} \end{array} \quad \begin{array}{r} 643.18 \\ 321.59 \\ \hline \end{array}$$

Sum, $\div 100 = 9.6477 = 9 \text{ l. } 12 \text{ s. } 11\frac{1}{2} \text{ d. the Answer.}$

Or thus,

$$\begin{array}{r} 2572.75 \\ 3 \\ \hline 8)7718.25 \\ \hline \end{array}$$

The Quotient $\div 100 = 9.6478$ the Answer as before.

III. An Example in Insurance.

What will the Insurance on 874 l. 13 s. 6 d. amount to at $13\frac{1}{2}$ per Cent. ?

$ \begin{array}{r} 874.675 \text{ at } 13\frac{1}{2} \\ \underline{13} \\ 11370.775 \\ \frac{1}{2} \quad 437.337 \\ \hline 118.08112 = \\ \hline 118 \text{ l. } 1 \text{ s. } 7\frac{1}{2} \text{ the Answ.} \end{array} $	<p>Or thus,</p> $ \begin{array}{r} 874.675 \\ \hline 10 \text{ is } \frac{1}{10} \text{ of } 100 \quad 87.4675 \\ 2\frac{1}{2} - \frac{1}{2} \text{ of } 10 \quad 21.8668 \\ 1 - \frac{1}{2} \text{ of } 10 \quad 8.7467 \\ \hline 118.0810 \end{array} $
--	---

C A S E II.

The *Amount*, *Rate per Cent.* and *Time* given, to find the *Principal*.

Rule. As the *Amount* of 100 l. at the *Rate* and *Time* given,
 Is to 100 l.
 So is the *Amount* given
 To the *Principal* required.

Example. What *Principal* or *Sum* being put to Interest will amount to 3998 l. 12 s. $10\frac{3}{4}$ d. in $3\frac{1}{4}$ Years and 54 Days, at 3 per Cent. per Annum ?

Or otherwise, thus,

What's the present Worth of 3998 l. 12 s. $10\frac{3}{4}$ d. due $3\frac{1}{4}$ Years and 54 Days hence, abating or discounting 3 per Cent. &c.

The

The Time 3.397945 as in *Examp. 8. page 112.*
 Multiply by 3 the Int. of 100 l. for 1 Year.

Product 10.193835 the Interest
 Add 100. } of 100 l. for the
 Sum 110.193835 the Amount } Time given.

Then, l. l. l.
 if 110.193835 — 100 — 3998.6448
 3998.6448 Mult.
 l. l. s. d.
 110.193835) 399864.48 (3628.737 = 3628 : 14 : 9 the
 3305815 Principal or present Worth
 required.

692829 Note. The *Principal* being subtrac-
 661163 ted from the *Amount*, the *Remain-*
 31666 der is the *Discont* (= 369.9078
 22039 l.) and this is the *true Method*
 of finding the present Worth
 or Discount of all *Debts*, due
 at any Time hereafter.

C A S E III.

The *Amount*, *Principal*, and *Time* being given, to find the *Rate* of Interest.

Rule, As the *Principal* multiplied by the *Time*,
Is to the *whole Interest*,
So is 100 *l.*
To the *Rate per Cent.*

Example. At what *Rate of Interest per Cent.* will 3628 *l.*
14 *s.* 9 *d.* amount to 3998 *l.* 12 *s.* 10 $\frac{1}{4}$ *d.* in $3\frac{1}{4}$ Years and
54 Days.

Mult.	3628.737 the Prin.	From 3998.6448 Amount
	549793.3 the Time	Sub. 3628.737 Princip.
	<hr/>	
	10886.2	Rem. 369.9078 the
	10886	<hr/>
	326.6	whole
	25.4	Interest.
	3.2	
	.1	

Then, as 12330.1 : 369.9078 :: 100 : 3 the *Rate per Cent.*
100

12330.1)3699078(3 *l.*
369903

....4

C A S E IV.

The *Principal Amount*, and *Rate* of Interest being given, to find the *Time*.

Rule, As the *Interest* of the *Principal* for 1 Year, at the given *Rate*,

Is to one Year;
So is the *whole Interest*
To the *Time* required.

Example

Example. In what Time will 3628 l. 14 s. 9 d. amount to 3998 l. 12 s. 10 $\frac{1}{4}$ at 3 per Cent?

Mult.	3628.737	From	3998.6448
	3	Sub.	3628.737

108.86211 Int. for 1 Year. The whole Int. 369.9078

	l.	Year.	l.	Year.
Then, as	108.86211	: 1 ::	369.9078	: 3.398 the Time required.
108.86211) 369.9078			
...	3266	Sub.	.25	= $\frac{1}{4}$ Year.

433 .148 = 54 Days.

S E C T. II. Of Rebate or Discount.

Rebate or Discount is an *Abatement* of *Part* of a Sum of Money, due some Time hence, in consideration of *prompt* or present Payment of the Remainder; and this is done at any Rate of Interest.

The true Way of discounting a Sum is by *Case 2.* in *Simple Interest*, but the Method used among *Bankers*, &c. in discounting Bills, is to find the *Interest* of the Sum drawn for from the Time the Bill is discounted to the Time when it becomes due, (including the Days of Grace) which *Interest* they reckon as the *Discount*, thereby making the Discount

Discount more than it really is; for Instance, 'tis evident that 105 *l.* payable a Year hence, if discounted at 5 *per Cent.* is worth 100 *l.* present Money; because 100 *l.* being put to Interest at that Rate for a Year will produce 105 *l.* so that the Discount in this Case must be 5 *l.*, whereas (by the common Way) the *Interest* for 105 *l.* for a Year at the same Rate is 5 *l.* 5 *s.* which is 5 Shillings more than the true Discount.

S E C T. III. Of Equation of Payments.

Equation of Payments is when several Sums of Money, to be paid at different Times, are reduced to one mean Time for the Payment of the whole, without Loss to Debitor or Creditor.

The common Way of working Questions in this Rule, is to multiply each Payment by its Time, and divide the Sum of all the Products by the whole Debt, the Quotient is reckoned the equated Time.

But the correct Way is first to find the present Worth of each Payment for its respective Time by Case 2d of Simple Interest; next add all the present Worths together, and call that Sum the Principal; then having the Principal, Amount, and Rate of Interest, find the equated Time by Case 4th of Simple Interest.

E X A M P L E.

A owes B 1000 *l.* whereof 200 *l.* is to be paid ready Money, 400 *l.* at 5 Months, and the rest at 10 Months; but they agree to make one Payment of the whole; Query, when must it be paid, the Discount being at 5 *per Cent.*?

First by the common Method.

l. M.n.

$$400 \times 5 = 2000$$

$$400 \times 10 = 4000$$

The Sum of the Products = 6000 which divided by 1000 the whole Debt, the Quotient is 6 Months, the Answer.

Now

Now for the other Method.

And first for the present Worth of each Payment by 2d Case of *Simple Interest*.

As 102.0833 (the Amount of 100 *l.* for 5 Months at 5 per Cent.) is to 100 *l.* so is 400 *l.* to 391.837 *l.* the present Worth thereof.

And as 104.1666, (the Amount of 100 *l.* for 10 Months at 5 per Cent.) is to 100 *l.* so is 400 *l.* to 384 *l.* the present Worth thereof.

Next add, $\left\{ \begin{array}{l} 200 \\ 391.837 \\ 384. \end{array} \right.$

975.837 the Sum of the present Worths
or Principal.

Then by Case 4th of *simple Interest*

Mult. 975.837 the Principal.
by 5

Prod. $\div 100 = 48.79185$ Int for 1 Year, or 12 Months.

From 1000.

Sub. 975.837

Remains 24.163 the Int. for the Time required.

Then it will be,

$\begin{array}{l} l. \quad M. \quad l. \quad Mon. \\ 48.792 : 12 :: 24.163 : 5.942 = 5 Mon. \end{array}$ 28.26 Days,
Mult. 30 the Answer.
Days 28.260

S E C T.

S E C T. IV. Of Compound I N T E R E S T.

Compound Interest is that which ariseth from the *Principal* and its *Simple Interest* (when due and forborn) reckoned together as a new Sum, so that both *Principal* and *Interest* here are always increasfing.

And although it be not lawful to let out Money at *Compound Interest*, yet in purchasing of *Annuities* or *Pensions*, and *Leases* in *Reversion*, it is very usual to allow *Compound Interest* to the Purchaser for *his ready Money*; and therefore it is very necessary to understand it.

C A S E I.

The *Principal*, *Rate of Interest*, and *Time*, (that is any Number of entire Years) being given to find the *Interest*.

R U L E.

1. Find the *Amount* of the given Sum by *Simple Interest*, for the first Year, which is the *Principal* for the second Year: Then find the *Amount* of that *Principal* for the second Year, and that is the *Principal* for the third Year; and so on for any Number of Years given.

2. Subtract the given Sum from the last *Amount*, and the Remainder is the *Compound Interest* required.

E X A M-

E X A M P L E I.

What's the Compound Interest of 524 *l.* 12 *s.* for 3 Years
at 4 *per Cent. per Annum*?

$$\begin{array}{r}
 \text{Mult.} \quad 524.6 \\
 \quad \quad \quad 4 \\
 \hline
 \text{Add} \left\{ \begin{array}{l} 20.984 \text{ the Interest} \\ 524.6 \text{ the Principal} \end{array} \right\} \text{for the 1st Year.} \\
 \hline
 545.584 \text{ the Amount} \\
 \quad \quad \quad 4 \\
 \hline
 \text{Add} \left\{ \begin{array}{l} 21.82336 \text{ the Interest} \\ 545.584 \text{ the Principal} \end{array} \right\} \text{for the 2d Year.} \\
 \hline
 567.40736 \text{ the Amount} \\
 \quad \quad \quad 4 \\
 \hline
 \text{Add} \left\{ \begin{array}{l} 22.6963 \text{ the Interest} \\ 567.4073 \text{ the Principal} \end{array} \right\} \text{for the 3d Year.} \\
 \hline
 \text{From} \quad 590.1036 \text{ the Amount} \\
 \text{Sub.} \quad 524.6 \text{ the Principal given.} \\
 \hline
 \text{Remains} \quad 65.5036 = 65 \text{ } l. \text{ } 10 \text{ } s. \text{ } 1 \text{ } d. \text{ nearly, the Interest required.}
 \end{array}$$

Another Rule for finding the *Amount* of any Sum at Compound Interest, is continually to multiply the *Principal* by the *Amount* of 1 *l.* for a Year. And

The *Amount* of 1 *l.* for a Year is found by only dividing the *Amount* of 100 *l.* for a Year by 100: thus if the *Rate* be 4 *per Cent.* the *Amount* of 100 *l.* for a Year is 104 *l.*

$$\begin{array}{l}
 \text{And } 100)104. \text{ (1.04} \\
 \text{Thus also } 100)104.5 \text{ (1.045} \\
 \text{And } 100)105. \text{ (1.05}
 \end{array}
 \left. \begin{array}{l} \\ \\ \end{array} \right\} \begin{array}{l} \text{the Amt of 1 } l. \\ \text{for a Yr at} \end{array}
 \left. \begin{array}{l} \\ \\ \end{array} \right\} \begin{array}{l} 4 \text{ per Cent.} \\ 4\frac{1}{2} \\ 5 \end{array}$$

R

To

To apply this to the last *Example*. What's the Amount of 524 *l.* 12 *s.* for 3 Years, at 4 *per Cent.* ?

Mult. 524.6 the Principal.

by 1.04 the Amount of 1 *l.* for a Year as above.

$$\begin{array}{r} 20984 \\ 5246 \\ \hline \end{array}$$

1st Prod. 545.584 the Amount for 1 Year.

$$\begin{array}{r} 1.04 \\ \hline 218236 \\ 545584 \\ \hline \end{array}$$

2d Prod. 567.40736 the Amount for 2 Years.

40.1 the Multiplier invert.

$$\begin{array}{r} 567.4073 \\ 22.6963 \\ \hline \end{array}$$

3d Prod. 590.1036 the Amount for 3 Years as before.

EXAMPLE II.

What is the Amount of 1 *l.* for 3 Years at 4 *per Cent.* ?

Mult. 1.04 } the Amount of 1 *l.* for 1 Year
by 1.04 } as before.

$$\begin{array}{r} 416 \\ 104 \\ \hline \end{array}$$

1.0816 the Amount of 1 *l.* for 2 Years.

$$\begin{array}{r} 1.04 \\ \hline 43264 \\ 10816 \\ \hline \end{array}$$

1.124864 the Amount of 1 *l.* for 3 Years,
viz. 1 *l.* 2 *s.* 6 *d.* nearly, the Answ
8 And

And thus by continually Multiplying by the Amount of *l. 1* for 1 Year, the Amount of *l. 1* for any Number of Years may be found at any *Rate per Cent*.

C A S E II.

The *Amount*, *Rate per Cent*, and *Time*, being given, to find the *Principal*.

Rule 1. As the *Amount* of *l. 100 Compound Interest*, at the *Rate* and *Time* given,
Is to *l. 100* :
So is the *Amount* given,
To the *Principal* required.

Or thus

Rule 2. As the *Amount* of *l. 1 Compound Interest* at the *Rate* and *Time* given,
Is to *l. 1*,
So is the *Amount* given,
To the *Principal* required.

E X A M P L E;

What *Principal* must be put to Interest to *Amount* to *l. 590.1036* in 3 years at 4 *per Cent per Annum*, *Compound Interest*?

Or in other Words,

What's the present *Worth* of *l. 590.1036* due 3 years hence, at 4 *per Cent*, &c.

First, the *Amount* of *l. 1* for the *Time* given, is *l. 1.124864*, as *per last Example*.

Then (by *Rule 2* of this *Case*) As *1.124864l. : 1l. :: 590.1036l. : 524.6l. = 524l. : 12s.* the present *Worth* or *Principal* required.

C A S E III.

The *Principal*, *Amount*, and *Rate* of Interest being given, to find the *Time*.

The General Rule for working this Case, is first to divide the *Amount* by the *Principal*, and then to divide that *Quotient* by the *Amount* of *l. 1* for a Year, the next *Quotient* by the same, and so continually divide the *Quotients* by the *Amount* of *l. 1* for a Year until nothing remains, that is, 'till the last *Quotient* be exactly *Unity*, and the *Number* of those *Divisions* will be the *Time* required.

E X A M P L E.

In what *Time* will *l. 524.6* amount to *l. 590.1036* at 4 per Cent?

First $524.6 : 590.1036 (= 1.124864)$ which is to be divided continually by 1.04 the *Amount* of *l. 1* for a Year.

thus $1.04) 1.124864 (1.0816$ first Division.
and $1.04) 1.0816 (1.04$ second Division.
again $1.04) 1.04 (1$ third Division.

Hence the *Time* is 3 Years.

This Method of finding the *Time* must be approved of, as being the *Converse* of the last Case (and moreover is deduced from the 1st *Theorem* in *Compound Interest* given by Authors who treat of it Algebraically) but I think a more ready way is to multiply the *Principal* continually by the *Amount* of *l. 1* for a Year (as in the 2nd *Method* of performing *Case 1*) until the *Product* be the same as the given *Amount*, and the *Number* of these *Operations* will be the *Time* sought. For an *Example*, see the 2nd *Method* of working the 1st *Example* in *Case 1*. where you will find the *Principal* and also the *Amount* at the third *Operation*, the same as the *Principal* and *Amount* above given; consequently the *Time* here required is 3 Years.

The

The next *Case* is to find the *Rate per Cent.* the *Principal*, *Amount*, and *Time* being given; but as this requires the *Extraction of Roots*, or the use of *Logarithms*, and is when known but of little or no Use, I therefore omit it.

The other *three Cases* may also be much better performed by *Logarithms*, or *Tables* calculated for that Purpose, than otherwise. The most useful Questions likewise in *Annuities at Compound Interest*, are much easiest answered by *Tables*; the Rules for solving them by the Pen being very intricate, the working of them laborious, and their reason not to be understood without the knowledge of *Algebra*. It must be acknowledged likewise that where dispatch is required, *Tables* are very requisite for the more expeditious finding the *Simple Interest* of any Sum, especially for Days.

I have therefore in *Chap. 9.* inserted *Tables of Interest*, both *Simple* and *Compound*, for solving Questions in *Interest*, *Annuities*, &c. so shall say nothing further here in Relation to *Annuities*, but conclude this Chapter with shewing in the two following Sections the manner of working Questions relating to *Freehold or Real Estates*, which if in *Reversion* may also be done easiest by *Tables*, as will appear by two or three Questions when I come to treat of their general Use.

S E C T. V.

Of Purchasing Freehold or Real Estates at Compound Interest.

All *Freehold or Real Estates* are such as are bought to continue for ever, and Questions relating to the purchasing of them (except in *Reversion*) may be done in the most simple manner, only by the *Rule of Three*, which is a much more easy and familiar Method than to work by the usual *Theorems* for performing Questions therein.

C A S E I.

Examp. A Person is desirous of laying out *l. 780* in the Purchase of a *Freehold Estate*, so as to get *4 per Cent.* for his

his Money *Compound Interest*. What must be the annual Income of such an Estate?

$$\begin{array}{r} \text{l.} \quad \text{l.} \quad \text{l.} \\ \text{If } 100 \text{ --- } 4 \text{ --- } 780 \end{array}$$

4

l. s.

the Product $\div 100 = 31.20 = 31 : 4$ the Answer.

'Tis obvious by this Example that the Answer to any Question in this Case, is nothing more than the simple Interest of the given Sum for one Year at any proposed *Rate per Cent*.

C A S E II.

Examp. Suppose a Freehold Estate of 31*l.* 4*s.* Yearly Income were to be sold: What is the Worth, allowing the Buyer 4 *per Cent. Compound Interest* for his Money?

$$\begin{array}{r} \text{l.} \quad \text{l.} \quad \text{l.} \\ \text{If } 4 \text{ --- } 100 \text{ --- } 31.2 \\ \quad \quad \quad 100 \end{array}$$

$$\begin{array}{r} 4 \overline{) 3120.0} \\ \underline{ 12} \\ 200 \\ \underline{ 80} \\ 0 \end{array}$$

78*ol.* the Answer.

C A S E III.

Examp. I. Suppose 1.780 is given for a Freehold Estate, the Income being 31*l.* 4*s.* *per Annum*: What *Rate per Cent. Compound Interest* has the Purchaser for his Money?

$$\begin{array}{r} \text{l.} \quad \text{l.} \quad \text{l.} \\ \text{If } 780 \text{ --- } 31.2 \text{ --- } 100 \\ \quad \quad \quad 100 \end{array}$$

$$\begin{array}{r} 780 \overline{) 3120.0} \\ \underline{ 3120} \\ 0 \end{array}$$

4 *per Cent* the Answ.

Examp.

Examp. 2. Suppose an Estate of 50*l.* per Annum is bought for 21 years Purchase, how much per Cent. Compound Interest has the Purchaser for his Money, supposing the Taxes, &c. to be 1.12 per Annum?

First $1.50 \times 21 = 1.1050$ the Money given for the Estate.
and $1.50 - 12 = 1.38$ the yearly Income

$\begin{array}{ccccccc} l. & l. & l. & l. & l. & s. & d. \end{array}$

Then as $1050 : 38 :: 100 : 3.69 = 3 : 12 : 4\frac{1}{2}$
the Rate per Cent. the Answer.

S E C T. VI.

Of Purchasing Freehold Estates in Reversion.

C A S E I.

The yearly Income of a Freehold Estate being known, to find the present Worth of the Reversion of the said Estate after the Expiration of a certain Number of Years at any given Rate per Cent.

1. Find the full Value of the Estate as in the 2d Case of the last Section.

2. By Case 2nd Compound Interest, find what Principal or Sum will amount to the full value of the Estate, at the Time and Rate given.

Example.

Suppose the Reversion of a Freehold Estate of 1.40 yearly Income to commence 3 Years hence, is to be sold, what is it Worth, allowing the Purchaser 4 per Cent. for his present Payment.

First, Agreeable to the 2nd Case of the last Section, it, will be

$\begin{array}{cccc} l. & l. & l. & l. \end{array}$

As $4 : 100 :: 40 : 1000$ the full Value of the Estate

Then by Case 2nd Compound Interest (as 1.1.124864 is the Amount of 1.1 for the Time and Rate given) it will be
As

$\begin{array}{ccccccc} l. & l. & l. & l. & l. & s. & d. \\ \text{As } 1.124864 : 1 :: 1000 : 888.996 = 888 : 19 : 11 \\ \text{the present Worth of the Reversion.} & \text{The Answer.} \end{array}$

C A S E II.

The *Sum* given for the Reversion of a Freehold Estate, to commence after a certain Number of Years, being known, to find the *yearly Income*, allowing the Purchaser so much *per Cent.* for his Money.

1. Find the *Amount* of the *Sum* given, to the *Time* from which the Reversion is to Commence, by *Case 1. of Compound Interest.*

2. Find the *yearly Income* which that *Amount* will purchase, as in *Case 1* of the last *Section.*

Example.

Suppose the Reversion of a Freehold Estate to commence 3 Years hence is sold for 889*l.* what must the yearly Income be, for the Purchaser to get 4 *per Cent.* for his Money?

First for the Amount of 1.889 for 3 years at 4 *per Cent.* by *Case 1 Compound Interest.*

$$\begin{aligned}
 889 \times 1.04 &= 924.56 \\
 924.56 \times 1.04 &= 961.5424 \\
 961.5424 \times 1.04 &= 1000.004096 \text{ the Amount.}
 \end{aligned}$$

Here the Amount of the given Sum for 3 years, (rejecting the Decimals) is found to be 1.1000. And the yearly Income which 1.1000 will purchase at 4 *per Cent.* is 1.40 (agreeable to *Case 1* of the last *Section*) which answers the Question.

C H A P. VIII.

The Use of DECIMALS in the Computation of Exchanges, &c.

S E C T. I.

Of EXCHANGE in general.

Exchange is the giving the *Money* of one Country for that of another, by Means of a Bill, Instrument, or Writing, called a *Bill of Exchange*.

Money, is either *Real* or *Imaginary*.

Real Money is any Species of current *Coin* passing at a certain Price by the Law of any Country, as a *Guinea*, a *Crown*, a *Shilling*, &c.

Imaginary Money (which is generally made use of in keeping Accounts) is a certain Quantity of Species, as a *Pound*, a *Mark*, an *Angel*, a *Noble*, &c.

The *Par of Exchange* is the *intrinsic Value* that the Money of one Country bears to that of another.

The *Course of Exchange*, is the *Current Price of Exchange*, always unsettled, being sometimes *above*, and sometimes *below* the *Par*, according to the various Circumstances and Accidents of *Trade* and *Nations*.

The Form of Bills of Exchange.

l. 500 at 36 : 2 Flem. per l. Sterl. London, 1 January 1757.

At three Days sight pay this my only Bill of Exchange to Mr. A. B. or Order, five hundred Pounds Sterling in Bank Money Exchange, at thirty six Schillings and two Grotes *Flem. per l. Sterling*, Value received of Mr. C. D. as per Advice from

Your humble Servant,

To Mr. G. H.
Merchant in *Amsterdam*.

W. l. s. d.

653 : 2 : 17 : 4 London 1st. of January, 1757.

At *Uſance* pay this my *ſecond* of Exchange (my *fiſt* not being paid) to Mr. A. B. or Order fix hundred fifty three Crowns, two Livres, ſeventeen Sous, and four Deniers, of the Current Money of France, unto us this Day known, Value received of Mr. C. D. as *per* Advice from

To Mr. G. H.
Merchant in *Paris*.

Your humble Servant,

E. F.

Note, The Buyer who fiſt purchaſes the Bill of the *Drawer*, is called the *Remitter*.

If a Bill is reſuſed Acceptance, or not paid when it becomes Due, the Bearer is immediately to get it proteſted, and ſend it back in proteſt to the *Drawer* or *Remitter*, on Neglect of which, he himſelf is answerable for the Money.

Bills Drawn at *Uſance* differ their times of Payment according to their Country; but in *England*, *France*, and ſeveral other Places, by *Uſance*, is meant *thirty days* from the Date of the Bill, excluſive of the *Days of Grace*.

There is commonly allowed *per Cent* for negotiating Bills, that is, when Money is *remitted* by means of a Bill of Exchange to a Correspondent in one Country, with Orders for him to *remit* the ſaid Sum to another; or when Orders are ſent to a Correspondent to *draw* upon one Place, and

remit

remit the Money to another; there is an Allowance of about $\frac{1}{2}$ per Cent (called *Commission*) for such Negotiation.

In all Countries where there are Banks, except here, the *Exchange* or *Bank Money* is considerably higher than the *Current Money*; the *Bank Money* being always composed of the finest and best Species of Gold or Silver Coins, such as the *Pars* have been fixed upon between Nations: And this Money being not always plenty enough to answer the end of Bills, the Merchants abroad are therefore many times obliged to take *Current Money* for their Bills of Exchange: But then they are allowed so much more per Cent in Payment, according to what the *Exchange Money* is worth more than the *Cash* or *Current money*, and this Difference, which is usually called *agio*, amounts to between 4 and 5 per Cent. nay sometimes at *Hamburgh* to 16 or 17 per Cent.

The requisites to be known in Exchanges are,

1. The Money every Country keeps their Accounts in.
2. The Money in which we Exchange with them; wherein is to be understood, what Places give the *certain* or fixed *Price*, and what give the *uncertain Price*: As for instance, *London* always gives the (Pound Sterling) *certain* when it Exchanges with *Holland*, *Flanders*, and *Hamburgh*; but when it Exchanges with *France*, *Portugal*, *Spain*, &c. *London* always gives an uncertain Number of Pence, which is the *uncertain Price*. and they give the *Certain*; as *France* gives the *Ecu* or *Crown*, *Portugal* the *Milree*, and *Spain* the *Piafre*; and so consequently where one Country gives the *Certain*, the other corresponding Country gives the *Uncertain*.

S E C T. II.

Of Great Britain.

Accounts are kept in *London*, and throughout the British Dominions, in Pounds, Shillings, Pence, and Farthings; reckoning 4 Farthings to a Penny, 12 Pence to a Shilling, and 20 Shillings to a Pound.

The *Coins* of Great Britain are

In Copper, a Farthing, and a Halfpenny valued at two Farthings.

In Silver, of eleven Ounces. and two penny weight Fine, with eighteen penny weight of Allay, called Sterling Silver.

A Piece valued at	{	6 Pence, or 12 halfpence, or 24 Farthings.
		12 Pence, called a Shilling.
		2s. 6d. called half-Crown.
		5 Shillings, called a Crown Piece.

There are likewise silver Pence, two Pences, three Pences, and Groat Pieces, but they are seldom to be met with.

The Gold *Coins* (of twenty two *Carats* fine, with two *Carats* of Allay, called Standard Gold) are

A Guinea, valued at 21 Shillings. And

Half a Guinea, valued at 10s. 6d.

Note, A *Carat* is $\frac{1}{24}$ part of a Pound, an Ounce, or any other Weight.

The Manner of computing the Exchanges between *London* and *Foreign Countries* will be shewn in the following Sections: In this I shall only add the subsequent Rules for *London* to remit or draw by, with an Observation on the *Par* of Exchange, &c.

Rules for London to Remit or Draw by.

You are to observe, that to *Spain*, *France*, *Portugal*, or any other Place, where they Exchange by the *Piece*, suppose at 38 Pence per Piaſtre; 30¹/₂d. per Crown, or at 5 s. 3 d. per Milree; the lower the Price is, the better it is for *London* to remit, because if I deliver £. 100 Sterling, for a Bill upon *France*, *Spain*, or *Portugal*, I can have more Piaſtres at 3 s. 2 d. than at 3 s. 5 d. per Piaſtre, or more Crowns at 30d. than at 32¹/₂d. per Crown for the ſaid £. 100. And the contrary is to be obſerved in *Drawing*.

But

But to *Holland, Hamburgh, and Flanders*, where the Exchange is at so much *per l. Sterling*, the *higher* the Price, the more it is for the advantage of *London* to remit to those Places: for every one must know it is better to get 35*s.* 6*d.* Dutch Money for 20 Shillings Sterling, than 34*s.* 6*d.* for the same: and the *contrary* is to be observed in Drawing.

And so for *Ireland, and the West Indies*, where they Exchange by the *l. 100*, the *higher* the Course between *London* and those Places are, the better it is for *London* to remit, that is to say, it is better to pay *l. 100* in *London*, and receive *l. 112* in *Ireland*, than to pay the same Sum in *London*, and to receive but 105 in *Ireland*; the same may be said of the *West Indie*.

And it is to be observed, that when the *Course of Exchange* is *above* the *Par* at those Places where they exchange by the *l. Sterling*, as at *Holland, &c.* and *below Par* where they exchange by the *Piece*, as at *France, &c.* it is a general Indication that our *Trade* is *prosperous*, and the *Nation* on the *gainful Side*: On the contrary, if it is *below Par*, where they exchange by the *l. Sterl.* and *above Par* where they exchange by the *Piece*, the *Trade* is *bad*, and the *Nation Loser*.

N. B. The *Prices of the Exchanges at London, Amsterdam, and Hamburgh*, have a very great Influence upon all the rest of *Europe*.

S E C T. III. Of Ireland, or Dublin.

Accounts are kept here in Pounds, Shillings and Pence, *Irish Money*, which is imaginary; they reckon as in *London* 12 Pence to a Shilling, and 20 Shillings to a Pound.

The *Par* of a *Pound Irish* is 18 *s.* 5½ *d.* *Sterling*; so that the *Par* of 108 *l.* 7¼ *s.* *Irish* is 100 *l.* *Sterling*.

The *Coins* current among them are some *English*, some *Spanish*, some *French*, some *Portuguese*, and some *Dutch*, &c.

The *Exchange* between *London* and *Dublin* is from 6 to 12 *per Cent.* Difference between the Money of *London* and that of *Dublin*; that is, supposing the *Rate of Exchange* to be at 10 *per Cent.* then 100 *l.* in *London* will be 110 *l.* at *Dublin*.

*The Use of Decimals**Examples of Exchanges.*

London remits to Ireland 273 l. 18 s. 6 d. Sterling, Exchange at 8 $\frac{1}{4}$ per Cent. what must be received in Ireland for this Remittance?

$$\begin{array}{r}
 \begin{array}{ccc}
 \text{l.} & \text{l.} & \text{l.} \\
 100 & \text{---} & 108\frac{1}{4} & \text{---} & 273.925 \\
 & & & & 108\frac{1}{4} \\
 & & & & \hline
 & & & & 2191.400 \\
 & & & & 27392.5 \\
 & & \frac{1}{4} & - & 135.962 \\
 & & \frac{1}{4} & - & 68.481 \\
 & & & & \hline
 \end{array}
 \end{array}$$

The Product $\div 100 = 297.89343 = 297 \text{ l. } 17 \text{ s. } 10\frac{1}{2} \text{ d.}$
Irish Money, the Answer.

Ireland remits to London 297 l. 17 s. 10 $\frac{1}{2}$ d. Irish, how much must be received in London for this Remittance, the Exchange at 8 $\frac{1}{4}$ per Cent.?

$$\begin{array}{r}
 \begin{array}{ccc}
 \text{l.} & \text{l.} & \text{l.} \\
 108.75 & \text{---} & 100 & \text{---} & 297.8934 \\
 & & & & \text{l.} \\
 108.75)29789.314(273.925 & = & 273 \text{ l. } 18 \text{ s. } 6 \text{ d.} \\
 \dots 21750 & & \text{Sterl. the Answer.}
 \end{array}
 \end{array}$$

		8538	
		6525	
		2013	
		1958	
		55	
		44	
		11	
		11	

Note, the 88 at the Right-hand of the Dividend is (.88) the 10^d. reduced to the *Decimal* of a *Shilling*, but the third Tern 5957.88 being multiplied by 100, moves the *Decimal Point* to the Right-hand. The same Thing is to be observed in several Examples in the following Sections, where the middle Term is 100.

S E C T. IV. *Of America and the West-Indies.*

In all the *British Dominions* in *America* and the *West-Indies* they keep their Accounts in Pounds, Shillings and Pence, as we do in *London*, but they call their Money *Currency*.

In the *British Islands* in the *West-Indies* they have so great Plenty of foreign *Coins*, that 7 Pounds of their *Currency* is valued at 5 Pounds *Sterl.* But in most of the *British Settlements*

ments upon the *Continent* they have very few *Coins* of any Sort circulating among them, so that they are obliged to give Notes of *Bank*, (which they call *Paper Money*) for very small Sums, and this Paper Money being subject to many Casualties, it causes a great Undervaluement of their *Currency*, it being sometimes at 6, 7, or 800 per Cent. Discount for *Sterling* (or for good Silver or Gold.)

The Method of bringing *Sterling* Money into their *Currency*, and the contrary, is exactly similar to the Examples in the last Section.

SECT. V. Of Amsterdam and Rotterdam.

In *Amsterdam* and *Rotterdam*, which are the principal Places of Exchange in *Holland*, they keep their Accounts in Guilders, Stivers, and Penningens, reckoning 16 Penningens to a Stiver, and 20 Stivers to a Guilder, which are sometimes called Florins.

They also reckon 8 Penningens to a Grote, or Penny *Flemish*, 2 Grotes to a Stiver; 12 Grotes or 6 Stivers to a Schilling; and 20 Schillings to one Pound *Flemish*, which is just the Value of 6 Guilders.

Of this Money, some is *real*, and some *imaginary*.

The *real* Money is the Stivers, Guilders, and Schillings.

The *imaginary* is the Penningens, Grotes, and Pounds.

Between *Holland* and *London* 12 Guilders is the *Par* of a Guinea *Sterling*, and 11 Guilders 8 $\frac{1}{2}$ Stivers, or 38 $\frac{1}{2}$ Schillings is the *Par* of one Pound *Sterling*, according to which their *Coins* are worth as follows, *viz.*

	Guild. Stiv.	Sterling.
A Date,	— : — $\frac{1}{8}$	— : — $\frac{1}{16}$
A Stiver,	— : 1	— : 12 $\frac{1}{2}$
A Schilling,	— : 6	— : 62 $\frac{1}{2}$
A Guilder or Florin,	1 : —	1 : 9
A Zealand Dollar,	1 : 10	2 : 7 $\frac{1}{2}$
A Rix Dollar,	— : 2 : 10	4 : 4 $\frac{1}{2}$
A Dry Guilder,	— : 3 : —	5 : 3
A Ducat,	— : 5 : 5	9 : 2 $\frac{1}{4}$

London

London exchanges with *Amsterdam* in Schillings, and Grotes Flemish, being a Mixture of the real and imaginary Money.

The *Course of Exchange* is between 30 and 40 Schillings *Flem.* per *l.* *Sterling*.

Before I proceed to the Examples I shall first give the following DECIMAL TABLES for turning *Stivers* and *Pennings* into the *Decimal of a Guilder*, and the contrary. Decimal Tables in the Computation of Exchanges being of equal Service with those of *Weights* and *Measures*, &c. in other Computations, and are used in the same Manner.

One *Guilder* the Integer.

T

Examples

Examples of Exchanges.

London remits to Holland 478 l. 14 s. 6 d. Sterling, the Exchange at 35 Schillings 6 $\frac{1}{2}$ Grotes Flem. Ban-o per l. Sterling; what must be paid in Holland for this Remittance?

$$\begin{array}{rcl}
 & 478.725 \text{ at } 1 \text{ l. } 15 \text{ s. } 6\frac{1}{2} \text{ Flem.} & \\
 10 \text{ s.} & - \frac{1}{2} & 239.3625 \\
 5 & - \frac{1}{2} & 119.6813 \\
 6 \text{ d.} & - \frac{1}{10} & 11.9681 \\
 \frac{1}{2} & - \frac{1}{12} & .9973 \\
 \hline
 \end{array}$$

$$\begin{array}{rcl}
 & 850.7342 \text{ l. Flem.} & \\
 \text{Mult. by} & 6 \text{ the Guilders in a l.} & \\
 \hline
 \end{array}$$

$$\begin{array}{rcl}
 & 5104.4052 \text{ Guilders.} & \\
 \text{Subtract} & .4 & = 8 \text{ Stiv.} \\
 \hline
 \text{Remains} & .0052 & = 2 \text{ Penn. nearly} \\
 \hline
 \end{array}
 \left. \vphantom{\begin{array}{rcl} 5104.4052 \\ .4 \\ .0052 \end{array}} \right\} \text{ per Tables.}$$

Hence the Answer is 5104 Guil. 8 Stiv. 2 Penn.

Or thus,

$$\begin{array}{rcl}
 \text{Multiply} & 478.725 \text{ at } 35 \text{ Sch. } 6\frac{1}{2} \text{ Gr. Flem.} & \\
 & 35 & \\
 \hline
 & 2393.625 & \\
 \text{gr.} & 14361.75 & \\
 6 - \frac{1}{2} & 239.362 & \\
 \frac{1}{2} - \frac{1}{12} & 19.947 & \\
 \hline
 & 17014.684 \text{ Schill.} & \\
 \text{Mult.} & .3 & \\
 \hline
 & 5104.4052 \text{ Guilders as before.} & \\
 \hline
 \end{array}$$

Note. Schillings are brought into Guilders by multiplying by 6 and dividing by 20; or, which is the same, by multiplying by 3 and dividing by 10, which is no more than multiplying by .3, as in the Work.

Holland

Ho'land remits to *London* 5104 *Guild.* 8 *Stiv.* and 2 *Pen.*
at 35 s. 6 d. *Flem. Banco*, per *l. Sterling*, what will this
Remittance amount to in *London*?

	<i>Sch. gr.</i>	<i>l.</i>	<i>Guil. St. Pen.</i>
	35 : 6½	1	5104 : 8 : 2
Mult. 12	12		40
Grotes 426½		426.5	204176.25
		.. . 17060	478.725 =
			the Answer.
		33576	
		29855	
		37212	
		34120	
		3092	
		2986	
		106	
		85	
		21	
		21	

Note, In multiplying by 40 (the Number of Grotes in a *Guilder*) 16 Grotes are taken in for the 8 *Stivers*, and the Decimal .25 is the 2 *Penningens* turned into the Decimal of a Grote. This Method of ordering with the first and third Numbers is often shorter than working *altogether* decimally, and therefore I have frequently used it in this Chapter.

It was observed in the 1st *Section* of this *Chap.* that in all foreign Countries, where there are Banks, the *Bank Money* is considerably higher than the *Current Money*; the Difference being called *Agio*.

The *Bank Money* of *Holland* is brought into current Money, and the current Money into *Bank Money*, as in the two following Examples.

T 2

Example

The Use of Decimals

Example 1. Reduce 3250 Guild 10 Stiv. and 8 Pen. Bank Money into Current Money, the *Agio* $4\frac{1}{2}$ per Cent.

$$\begin{array}{r}
 10 \text{ Stiv.} = .5 \\
 8 \text{ Pen.} = .025 \\
 \text{Guil Cur.} \quad \underline{\hspace{1cm}} \\
 \text{Guild. Bco.} \quad 100 \text{ --- } 104\frac{1}{2} \text{ --- } 3250.525 \quad \text{Guild. Bco.} \\
 \text{Multiply by} \quad \quad \quad 104\frac{1}{2} \\
 \hline
 13002.100 \\
 325052.5 \\
 1625.26 \\
 406.31 \\
 \hline
 \text{The Product} \div 100 = 3400.8617 = 3400 : 17 : 4 \text{ the} \\
 \text{Sub.} \quad .85 = 17 \text{ Stiv.} \quad \text{Ans.} \\
 \hline
 \text{Remains} \quad .0117 = 4 \text{ Pen. nearly.}
 \end{array}$$

Example 2. How much Bank Money will 3400 Guild. 17 St. 4 Pen. Current Money come to, when the *Agio* is at $4\frac{1}{2}$ per Cent.?

$$\begin{array}{r}
 \text{Guil. Cur.} \quad \text{Bco.} \quad \text{Guil. Cur.} \\
 104\frac{1}{2} \text{ --- } 100 \text{ --- } 3400.862 \\
 8 \quad \quad \quad 8 \\
 \hline
 837 \\
 837) 2720689.6 (3250.525 \text{ Guil. Bco.} \\
 2511 \quad = 3250 \text{ Guil. 10 Sti.} \\
 \hline
 2096 \quad 8 \text{ Pen. the Answer.} \\
 1674 \\
 \hline
 4228 \\
 4185 \\
 \hline
 4396 \\
 4185 \\
 \hline
 2110 \\
 1674 \\
 \hline
 4360 \\
 4185 \\
 \hline
 \end{array}$$

In like Manner with the foregoing Examples, the Bank Money of any Country may be reduced to current Money, and Current Money to Bank Money.

A Merchant in *Amsterdam* owes one in *London* 2154 *Guil.* 12 *Stiv.* 4 *Pen.* Current Money, how much *Sterling* must the Merchant in *London* receive for his Draught, when the Exchange is at 35 *s.* 3½ *d.* *Flem. Bco.* per *l. Ster.* *Agio* 4½ per Cent.?

$$\begin{array}{rcl}
 & 12 \text{ Stiv.} & = .6 \\
 & 4 \text{ Pen.} & = .0125 \\
 \text{Guil. Cur.} & \text{Bco.} & \text{---} \\
 104.5 & \text{---} 100 & \text{---} 2154.6125 \text{ Cur.} \\
 & & \text{---} \\
 104.5)215461.250 & (2061.83 \text{ Guil. Bco.} & \\
 2090 & & \\
 \hline
 & \text{s.} & \text{d.} & \text{l. Guild. Bco.} \\
 6461 & 35 & 3\frac{1}{2} & \text{---} 1 \text{---} 2061 \text{ } 83 \\

The Answer is 2154 *Guild.* 12 *Stiv.* 4 *Pen. Cur. Money.*

S E C T. VI. Of Antwerp.

Next to *Amsterdam* and *Rotterdam*, *Antwerp* is the principal Place of Exchange in the *Netherlands*.

Accounts are kept here in Pounds, Schillings, and Grotes or Pence *Flemish*, reckoning, as in *Amsterdam*, 12 Grotes to a Schilling, and 20 Schillings to a Pound.

The Schillings only are *real*. The *Coins* current in *Antwerp* are much the same as in *Holland*.

The Manner of exchanging with *London* and the *Par* of Exchange is the same as at *Amsterdam*; the Exchange being in Schillings and Grotes; and 38 ⅓ Schillings the *Par* of 1 *l. Sterling*.

The *Course* of Exchange is also between 30 and 40 Schillings *Flem.* per *l. Sterling*.

Exam-

Examples of Exchanges.

How much Money of *Antwerp* will 1011 l. 18 s. 4¹ d. *Sterling* come to, when the Exchange is at 36 s. 6 d. *Flem.* per l. *Sterling*.

	l.	s.	d.	
	1011.9177			at 36 : 6 <i>Flem.</i>
d.	809.5342	=	1011.9177	the Dec. of

				73)73870(1011.9178=
				1011 : 18 : 4 $\frac{1}{4}$ <i>Ster.</i>

S E C T. VII.

A great many of the principal Towns and Cities in the *Netherlands* exchange among themselves at so much *per Cent.* more or less, according as the Demands and Necessities are, which does not usually rise to above $\frac{1}{8}$, $\frac{1}{4}$, $\frac{3}{4}$, or $\frac{1}{2}$ *per Cent.* except upon some extraordinary Occasions; notwithstanding, when they do remit to, or draw upon *England*, or any foreign Place, by the Way of *Amsterdam*, the Advance is commonly 1 or $1\frac{1}{2}$ *per Cent.* which is mostly owing to the Scarcity or Want of Bills for *England*, or upon such-like Occasions.

Examples of Flanders Exchanges.

Flanders draws upon *Holland* for 473 l. 18 s. 6 d. Exchange Money, at $1\frac{1}{2}$ *per Cent.* Advance, or in Favor of *Amsterdam*, to know what this Draught will amount to in *Amsterdam*?

l. Fland. l. Amst. l. Fland.

Answer, 2801 Guild. 10 Stiv.
and 8 Pen. must be paid in
Amsterdam.

Holland

Guild. Siv. Phen.

Holland remits to Flanders 2801 : 10 : 8 to receive in Flanders for every 100 Guilders, or 100 l. Flemish, 101½ how much will this Remittance amount to in Flanders.

6)2801.525 Guild.

l.	l.		
100	1½	466.921	l. Flem.
	½ -	233.46	

The Sum ÷ 100 = 7.00381 the Advance

Add, 466.921

Answer, 473.9248 = 473 : 18 : 6 must be received in Flanders.

This Question might also be done in the same manner as the Example in the 5th Section for bringing Bank Money into Current Money, making 101½ the middle Term.

SECT. VIII. Of Hamburgh.

Hamburgh is the principal Place of Exchange in all Germany.

Accounts are kept here in the Bank, and by the greater Part of the People in Marks, Shillings Lubs, and Phenings.

And some keep them (as they do in Antwerp) in Pounds, Schillings, and Grotes Flemish.

Of the above Money, only the Phenings, and Shillings Lubs are Real.

They reckon 12 Phenings to one Shilling Lubs, and 16 Lubish Shillings to a Mark.

They also reckon 6 Phenings, or ½ Shilling Lubs, to 2 Grote Flemish; 12 Grotes Flemish, or 6 Shillings Lubs, to one Schilling Flemish; and 20 Schillings Flemish, or 7½ Mark Lubs, to one Pound Flemish. And 3 Mark Lubs, or 8 Schillings Flemish, make a Rixdollar.

Between Hamburgh and London, a Mark or 16 Lubish Shillings is the Par of 15. 6d. Sterling; so that 13 Marks 5 Shillings, and 4 Phenings Lubs, or 35 Schillings 6½

l.

Grotes

Grotes Flemish, is the *Par* of 1*l.* Sterling. Hence the Value of their *Coins* is as follows, *viz.*

A Tryling $\frac{1}{4}$ of a Phenning	=	$\frac{3}{128}$	} of a Penny Sterl.
A Sexling $\frac{1}{2}$ of a Phenning	=	$\frac{3}{64}$	
A Phenning $\frac{1}{2}$ of a Shil. Lubs	=	$\frac{3}{32}$	
A Shilling Lubs — —	=	$1\frac{1}{8}$	

A Dollar at 2 Marks, or 3 Shillings Sterling.

A Rixdollar at 3 Marks or 4*s.* 6*d.* Sterling.

A Ducat at 6 $\frac{1}{4}$ Marks, or 9*s.* 4 $\frac{1}{2}$ *d.* Sterling.

The *Exchange* between *London* and *Hamburgh*, is in Schillings and Grotes Flemish, which are only Imaginary.

The *Course of Exchange* is from 32 to 38 Schillings Flemish, *per l.* Sterling.

T A B L E S for turning Lubish Shillings, and Pennings into the Decimal of a Mark, and the contrary.

 \hline
 \text{Remains} \quad .1547 = 2 \text{ Sh. 6 Ph. nearly.}
 \end{array}$$

Hence the Answer is 7465 Marks, 14 Shill. 6 Phen. *Current Money*.

S E C T. IX. Of Paris, Bourdeaux, &c.

Paris and *Bourdeaux* are the principal Places of Exchange in *France*.

Accounts are kept throughout the *French* Dominions in Livres, Sols, and Deniers, reckoning 12 Deniers one Sol, and 20 Sols one Livre.

Their Livres are imaginary, and they reckon 3 to an *Ecu* or *Crown*, the *Par* of which is $29\frac{1}{4}$ Pence Sterling. Hence the Value of their *Coins* is as follows, viz.

				Sterling	
				s.	d.
A Denier	—	—	—	-	: - $\frac{1}{325}$
A Liard	—	= 3 Deniers	—	-	: - $\frac{1}{325}$
A Dardene	—	= 2 Liards	—	-	: - $\frac{1}{650}$
A Sol	—	= 2 Dardenes	—	-	: - $\frac{1}{325}$
A Frank	—	= 20 Sols or 1 Livre	-	:	9 $\frac{1}{4}$
A Crown or <i>Ecu</i>	=	60 Sols or 3 Livres	2	:	5 $\frac{1}{4}$
A Double Crown	=	120 Sols or 6 Livres	4	:	10 $\frac{1}{2}$
A Lewis d'Or	=	8 Crowns or 24 Livres	19	:	6
They have likewise $\frac{1}{2}$ Crowns, and $\frac{1}{4}$ Crowns,					
$\frac{1}{2}$ Franks, and $\frac{1}{4}$ Franks.					

London Exchanges with *Paris*, &c. by the *Ecu* or *Crown*, of 3 Livres or 60 Sols Tournois.

The *Course of Exchange* is generally something above 30 Pence Sterling per *Ecu* or *Crown*.

Examples of Exchanges.

If *London* draws on *Paris* for 356*l.* 18*s.* 10*d.* Sterling. Exchange at $30\frac{1}{4}$ *d.* per *Ecu*; how many Livres, &c. will it amount to?

d.	Livres	l.	s.	d.

&c.

Note, The *De-*
cimal of a Livre is
brought into Sols
and Deniers, just
as the *Decimal* of
a Pound Sterling is

brought into Shillings and Pence. And the contrary.

When the first Term in the *Rule of Three*, is *Pence*, or *Pence* and *Farthings*, it is generally shorter to reduce the first and third Numbers as above, than to work wholly by Decimals.

Livres s. d.

A Merchant in *Paris* owes one in *London* 8426 : 3 : 3
how much Sterling Money must the Merchant in *London*
receive for his Bill drawn for the said Sum, Exchange at
30¹d. Ster. per Ecu or Crown?

divide

divide by 3)8426.164 Livres

the Quotient is $\overline{2808.7213}$ Crowns at $30^{\frac{3}{4}}d.$

$$\begin{array}{r} 30 - \frac{1}{8} \quad 351.0901 \\ \frac{1}{2} - \frac{1}{60} \quad 5.8515 \end{array}$$

Sum $\underline{l. 356.9416} = 356l. 18s. 10d.$ the Answer.

If London remits to France 82l. 15s. 4d. Ster. the Exchange at $30^{\frac{3}{4}}d.$ per Ecu; how many Crowns, Livres, &c. must be received in France for this Remittance?

$d.$	Ecu	$l.$	$s.$	$d.$	
$30^{\frac{3}{4}}$	— 1 —	82	: 15	: 4	Cro.
8		20			.959

S E C T. X. Of Lisbon, Oporto, &c.

Lisbon and *Oporto* are the principal Places of Exchange in *Portugal*.

Accounts are kept in general throughout the *Portugal* Dominions in Milreas and Reas (which are imaginary) 1000 Reas making a Milrea. They separate the thousands or Milreas from the Reas thus 735 \ominus 426, which is as much as to say 735 Milreas and 426 Reas.

The *Par* of a *Milrea* is 5s. 7½d. *Sterling*.

The Current Coins of *Portugal* are as follow, viz.

In Copper. They have Vintins, ½ Vintins, and ¼ Vintins,

	Reas	Sterling l. s. d.
A Vinten is _____	20	- : - : 1 $\frac{7}{10}$
<i>In Silver.</i>		
A Testoon = 5 Vintins _____	100	- : - : 6 $\frac{1}{4}$
A Crusade of Exch. = 4 Testoons, or ½ Moidore _____	400	- : 2 : 3
A new Crusade = 24 Vintins, or ¼ Moidore _____	480	- : 2 : 8 $\frac{1}{2}$
<i>In Gold.</i>		
A Moidore = 48 Testoons _____	4 \ominus 800	1 : 7 . -
A Joanesse = 64 Testoons _____	6 \ominus 400	1 : 16 . -
Also Pieces of 4 Joanesse, Double Joanesse, ½ Joanesse, ¼ Ditto, and ⅛ Ditto.		
Likewise 5 Moidore Pieces, 2½ Moidore Pieces, ½ Moidores, ¼ Ditto, and ⅛ Ditto		

London Exchanges with *Lisbon*, &c. by the *Milrea*, the *Course of Exchange* being from 5 Shil. to 5s. 8d. *Sterling*, per *Milrea*.

Examples of Exchanges.

London remits to Oporto 329*l.* 12*s.* 10*d.* Sterling, what will this Remittance amount to in Oporto at 5*s.* 3½*d.* per Milrea?

$$\begin{array}{rcl} d. & \text{Milrea} & l. \quad s. \quad d. \\ 63\frac{5}{8} & \text{---} 1 \text{---} & 329 : 12 : 10 \\ 8 & & 20 \end{array}$$

Oporto remits to London 1243⊖442 at 5*s.* 3½*d.* Exchange. How much Sterling must be paid in London for this Remittance.

1234.442 at 5*s.* 3½*d.* per Milrea.

$$\begin{array}{rcl} s. & & \\ 5 & - & \frac{1}{4} \quad 310.8605 \\ 3d. & - & \frac{3}{20} \quad 15.543 \\ \frac{4}{8} & - & \frac{1}{20} \quad 2.5905 \\ \frac{1}{8} & - & \frac{1}{4} \quad .6476 \end{array}$$

$$\begin{array}{rcl} \text{Answer.} & 329.6416 & = 329 : 12 : 10 \end{array}$$

SECT.

S E C T. XI. Of Cadiz, Madrid, Bilboa, &c.

In *Cadiz, Madrid, and Bilboa*, which are the principal Places of Exchange in *Spain*, they keep their Accounts in Piaftres, Rials, and Marvedies, reckoning 34 Marvedie to a Rial Plate, and 8 Rials Plate to a Piaftre of Exchange:

The *Piaftre* is imaginary, the *Par* of it is 3 s. 7 d. *Ster.*

The Spanish Coins in Copper and Silver are, *Sterling.*

	s.	d.
A Marvedie.	—	—
A Quartil = 2 Marvedies,	—	—
A Rial Plate, = 17 Quartiles, or 34 Marv.	—	—
A Piaftre, = 2 Rials Plate,	—	—
A Dollar, (old Plate) of Seville, = 10 Rials	4	6
Ditto, of new = 8 Rials Plate,	3	7
Mexico ditto,	4	6
Pillar ditto,	4	6
Peru ditto, (old Plate)	4	5
A Crofs Dollar,	4	4

The above Dollars, and also the Fractions of the same, are valued according to their Weight.

Their *Gold Coins* are Pistoles, and Fractions of the same.

A Pistole is 4 Dollars, or 17 s. 11 d. *Sterling.*

The Exchange between *London* and *Cadiz, &c.* is in Piaftres of 8 Rials.

The *Course of Exchange* is between 35 and 40 Pence *Sterling* per *Piaftre*.

T A B L E S for turning Rials and Marvedies into the Decimal of a Piaftre, and the contrary.

S E C T. XII. Of Genoa.

They keep their Accounts here in Pezzoes, Soldi, and Denari, reckoning 12 Denari to a Soldi, and 20 Soldi to a Pezzo of Exchange of 5½ Lires.

The Pezzoes and Lires are imaginary.

s. d.

The Par of $\left\{ \begin{array}{l} \text{A Pezzo is } 4 : 4 \text{ Sterling.} \\ \text{A Lire, } - \quad 9 \end{array} \right.$

They keep their Accounts sometimes in Lires, Soldi, and Denari.

1 Lire is 20 Soldi of the Lire. And
1 Soldi of the Lire, is 12 Denari of the Lire.

The Genoese Coins are, Sterling.

	s.	d.
A Denari, - - -	—	— ² / ₃
A Soldi, = 12 Denari - -	—	— ² / ₃
A Chevalet, = 4 Soldi, - -	—	1 ¹ / ₃
A Tesloon, = 30 Soldi, - -	1	1 ¹ / ₂
A Genouini, = 6 Tesloons, -	6	9
A Pistole, = 20 Lires, - -	15	—
A Spanish Pistole, = 24 Lires, -	17	11

The Exchange between London and Genoa is in Pezzoes, of 5½ Lires.

The Course of Exchange is between 45 and 50 Pence Sterling per Pezzo of 5½ Lires, or 115 Soldi of the Lire each Pezzo, but in computing their Exchanges they reckon (as above mentioned) 12 Denari to a Soldi, and 20 Soldi to a Pezzo. Hence Exchange Money is brought into Lire Money, and Lire Money into Exchange Money, as in the two following Examples.

Note, Soldi and Denari are brought into the Decimal of a Pezzo, or Lire, the same as Shillings and Pence are brought into the Decimal of a Pound Sterling, and the contrary.

Example

Example 1. Bring 13868 Pezzo, 13 Soldi, 7½ Denari, into *Lire* Money.

*Pezzo*s.

			Answer.

S E C T. XIII. Of Leghorn.

They keep their Accounts here in Piaſtres, Soldi, and Denari, reckoning (as at *Genoa*) 12 Denari to a Soldi, and 20 Soldi to a Piaſtre, but the Piaſtre is valued at 6 Lires.

The Lires are imaginary.

	s.	d.	<i>Sterling.</i>
The Par of the	{ Piaſtre is	4 : 4	
	{ Lire	<hr/> 8 $\frac{2}{3}$	

The Coins of *Leghorn* are,

			<i>Sterling.</i>
	s.	d.	
A Denari	—	—	— : — $\frac{13}{160}$
A Quatrini	— =	4 Denari	— : — $\frac{13}{40}$
A Soldi	— =	3 Quatrini	— : — $\frac{13}{120}$
A Craca or Grain	— =	5 Quatrini	— : — $\frac{13}{80}$

			s.	d.
A Julio or Paulo	— =	8 Grains	—	- : 5 $\frac{1}{2}$
A Piaſtre of Exchange	=	120 Soldi	—	4 : 4
A Ducat	— =	150 Soldi	—	5 : 5
A Piſtole	— =	21 Lires	—	15 : 6

The *Exchange* between *London* and *Leghorn*, is in Piaſtres, at 6 Lires or 120 Soldi of the Lire each Piaſtre.

Pias. Sol. Denari.

So that 325 : 5 : 8 make 1951 Lires, 14 Soldi.
multiply 6

1951 : 14 : -

The *Course of Exchange* is between 45 and 50 Pence Sterling per *Piſfire*.

The manner of computing their Exchanges being ſimilar to the Examples in the laſt Section; Examples here are therefore needless.

S E C T. XIV. Of Venice.

Accounts are kept here in Ducats Banco and Gros, which are imaginary, reckoning 24 Gros to a Ducat.

		s.	d. Ster.
The Par of	{ A Ducat Banco is	4	: 4.
	{ A Gros	-	: 2 $\frac{1}{2}$

Some keep their Accounts in Lires, Soldi, and Denari.

A Lire is 20 Soldi

A Soldi 12 Denari.

The Lire is Imaginary; the *Par* of it is 6 $\frac{1}{3}$ $\frac{1}{3}$ d. Sterling,
1 Ducat Banco is 7 $\frac{1}{3}$ Lires, and 1 Gros is 6 $\frac{1}{2}$ Soldi.

The Coins of Venice are, s. d. Sterling.

A Picoli	—	—	---	- :	$\frac{6}{181}$
A Soldi	—	= 12 Picoli	---	- :	$\frac{6}{181}$
A Jule	—	= 18 Soldi	---	- :	$\frac{5}{181}$

S E C T. XV.

Examples shewing the Advantages to be made by taking the Opportunity of the falling and rising of the Exchange.

Example 1. The Exchange between London and Amsterdam being at 35s. 6d. Flem. per l. Sterling, London remits to Holland 1597½ Guilders; but upon the fall of the Exchange to 34s. 6d. London draws for the said 1597½ Guilders back again. What does London gain per Cent by this Negotiation?

Schil.	l. Ster.	Schil.
34.5	100	35.5
	35.5	
	l.	

34.5	3550.0	(102.898

1000		
690		
3100		
2760		
3400		
3105		
2950		
2760		

from this Quotient subtract 100l. the Remainder is 2.898l. = 2l. 17s. 11½d. And so much London gains per Cent. including Charges, by this Negotiation. As may be made to appear, first by finding how much Sterling the 1597½ Guilders will come to, at 35s. 6d. per l. and then at 34s. 6d. the difference of which Sums will be the whole Gain, by which you may find the Gain per Cent.

				207	
				<hr/>	
				1125	
				1035	
				<hr/>	
				900	
				898	
				<hr/>	
				720	
				&c.	

So that 150*l.* Sterling is paid for the Remittance to *Holland* of 1597½ Guilders, and 154.348*l.* received for the Draught on *Holland* for the said Guilders back again, and consequently the Gain on 150*l.* Ster. is 4.348*l.* then, As 150*l.* : 4.348*l.* :: 100*l.* : 2.898*l.* the Gain *per Cent.* as before.

Example 2. The Exchange at *Amsterdam* for *London* being at 34*s.* 6*d.* *Holland* remits to *London* 150*l.* Sterling, but upon the rise of the Exchange to 35*s.* 6*d.* *Holland* draws for the said 150*l.* back again: What does *Holland* gain *per Cent.* by this Negotiation?

The Operation to this Question being the same as in the last, the Gain is the same in favour of *Holland*, that is,

Schil. Guild. Schil. Guild.

As 34*s.* : 100 :: 35.5 : 102.898. Hence the Gain in favour of *Holland* is 2.898 Guilders *per Cent.*

S E C T. XVI. Of Arbitration of Exchanges.

When a *Factor* has Orders from his Correspondent to *remit* a certain Sum of Money to any Place, provided he can do it at a certain Price of Exchange, and then to *Value* or *Draw back* again upon some other Place, at a certain Price for the Value of the Sum remitted; it may happen, as the Price of Exchange is continually fluctuating, that there may be a *Loss* in fulfilling the one Part of his Commission, and perhaps a *Gain* in the other. In such Cases the *Factor* is to consider whether the *Gain* in performing one part, will be equal to the *Loss* by the other; and the Operation necessary for such Discovery is *Simple Arbitration of Exchanges*: It may be called *Simple Arbitration* as being performed only by *one* Operation in the *Rule of Three*: whereas Questions that require *more than one* Operation; which is the Case, when instead of remitting directly to any certain Place, the Money is first remitted through one, two, or more different Countries; the answering such Questions is called *Compound Arbitration*.

Examples in Simple Arbitration.

An Order comes to *London* to remit to *Venice* 1000 Ducats at 48*d.* per Ducat, and to draw upon *Spain* for the Value at 3*d.* per Piaſtre; when the Order came to hand, Bills for *Venice* were at 50*d.* At what Price must *London* draw upon *Spain*, to compensate the said Loss by the Remittance to *Venice*?

d.	d.	d.
48	— 50 —	38
		50

	Answer.
48) 1900(39½ <i>d.</i> per Piaſtre, that is,
144	<i>London</i> must draw upon
—	<i>Spain</i> at 39½ <i>d.</i> per
460	Piaſtre, to compensate
432	the aforeſaid Loss, as is
—	evident from the follow-
28	ing Work.
— = 7	
48	

Z

First,

First, 1000 Ducats at 4s. come to 200l. Ster:

$$\begin{array}{r} s. \\ 4 - \frac{1}{5} \quad 200 \\ \hline \end{array}$$

Next, for the Draught on Spain at 38d. per Piaſtre.

$$\begin{array}{r} d. \quad Pias. \quad l. \\ \text{If } 38 \text{ --- } 1 \text{ --- } 200 \\ \quad \quad \quad 240 \\ \hline \quad \quad \quad \text{Piaſtres} \\ 38)48000(1263.158. \end{array}$$

According to the Order, *London* is to draw upon *Spain* for 1263.158 Piaſtres.

Now for the 1000 Ducats at 50d.

$$\begin{array}{r} 50 \\ \hline 12)50000 \\ \hline 2|0)416|6 - 8 \\ \hline l. 208:6:8 \end{array}$$

$$\begin{array}{r} d. \quad Pias. \quad l. \quad s. \quad d. \\ \text{Laſtly, if } 39\frac{1}{2} \text{ --- } 1 \text{ --- } 208 : 6 : 8 \\ \quad \quad \quad 12 \quad \quad \quad 20 \\ \hline \quad \quad \quad 475 \quad \quad \quad 4166 \\ \quad \quad \quad \quad \quad \quad 12 \\ \hline \quad \quad \quad \quad \quad \quad 50000 \\ \quad \quad \quad \quad \quad \quad 12 \\ \hline \quad \quad \quad \quad \quad \quad \text{Piaſtres.} \\ 475)600000(1263.158 \text{ as be-} \end{array}$$

fore.

Hence it appears that remitting to *Venice* at 50d. per Ducat, and Drawing on *Spain* at 39½d. per Piaſtre, comes to the ſame number of Piaſtres as remitting at 48d. and drawing at 38d. according to the Order.

An

Simple Arbitration of Exchanges. 171

An Order comes to *Amsterdam* to remit to *Genoa* at 82*d* per *Pezzo*, and to draw upon *London* for the value at 33*s*. 4*d*. per *l*. *Sterl*. When the Order came to hand, Bills for *Genoa* were at 85*d*. At what Price must *Amsterdam* draw upon *London* to compensate the said Loss by the Remittance to *Genoa*?

$$\begin{array}{rclcl} d. & d. & s. & d. & \\ 82 & \text{---} & 85 & \text{---} & 33 : 4 \\ & & & & 85 \end{array}$$

$$\begin{array}{rclcl} & & 165 & & \\ & & 264 & & \\ d. & & & & \\ 4 & - & \frac{1}{3} & 28 : 4 & \\ & & & & s. \quad d. \\ 82)2833 : 4(34 : 6\frac{2}{3} \\ & & 246 & & \end{array}$$

Amsterdam must draw upon *London* at 34*s*. 6*d*. per *l*.

$$\begin{array}{rclcl} & & 373 & & \\ & & 328 & & \\ & & 45 & & \\ & & 12 & & \\ & & \text{---} & & \\ 82)544(6 & & & & \\ & & 492 & & \\ & & \text{---} & & \\ & & 52 & & \\ & & 8 & & \\ & & \text{---} & & \\ 82)416(5 & & & & \\ & & 410 & & \\ & & \text{---} & & \\ & & 6 & & \end{array}$$

A of *Amsterdam* orders *B* of *Paris* to remit to *London* at 30 *d.* per *Crown*, and to value himself upon him at 54 *Grotes* per *Crown*, but upon Receipt of the Order he finds *Paris* Exchange upon *London* at 30½ *d.* and upon *Amsterdam* at 54¾ *Grotes*. Now the Query is, if at these Rates the Order could be performed?

$$\begin{array}{r} d. \quad d. \quad d. \\ 30 \text{ --- } 54 \text{ --- } 30\frac{1}{2} \\ 2 \quad 61 \quad 2 \end{array}$$

$$\begin{array}{r} 60 \quad 54 \quad 61 \\ \quad 32\frac{1}{2} \\ \hline 60)3294 \\ \hline 54.9 \text{ Grotes.} \end{array}$$

So that this Order may be performed with Profit, because if the Remittance to *London* be at 30½ *d.* the Draught on *Amsterdam* may be at 54¾ *d.* and their present Bills are at lefs, namely, at 54¾ *d.*

Paris orders *London* to remit at 30¼ *d.* per *Crown*, and to value himself upon *Amsterdam* at 36 *s.* 2 *d.* per *l.* when the Order came, the Exchange at *London* upon *Paris* was at 30¾ *d.* at what Rate must *London* draw upon *Amsterdam* to compensate the Loss by the Remittance to *Paris*?

$$\begin{array}{r} d. \quad 121 \quad d. \\ 30\frac{1}{4} \text{ --- } 36 : 2 \text{ --- } 30\frac{3}{4} \\ 4 \quad \quad 4 \\ \hline 121 \quad 726 \quad 123 \\ 363 \\ 2d. - \frac{1}{8} \quad 20 : 2 \end{array}$$

123)4376 : 2 (at 35 *s.* 7 *d.* *London* must draw upon *Amsterdam*.

$$\begin{array}{r} 369 \\ \hline 686 \\ 615 \\ \hline 71 \\ 12 \\ \hline 123)854(7 \\ 861 \\ \hline \end{array}$$

Rome is indebted to *Naples* 2000 Stampt Crowns, and accordingly *Naples* orders *Lions* to draw upon *Rome* for the said Crowns, at 42 Stampt Crowns for 100 French Crowns, and to remit the said Sum to *Naples* at 75 $\frac{1}{2}$ Ducats for 100 Crowns: But when this Commission arrived, Bills for *Naples* were at 74 $\frac{2}{3}$ Ducats; the Question is, how must *Lions* draw upon *Rome*, so as to be able to remit to *Naples* the Number of Ducats intended by the Order, allowing $\frac{2}{3}$ per Cent. for his Commission?

nearly.

Lions must draw upon *Rome* at 41.53642 Crowns, as will appear by finding how many Ducats the 2000 Stampt Crowns will amount to; first, at the commissioned Price, and then at the last Price to *Naples*, and at 41.53642 Crowns to *Rome*.

First, at the commissioned Price,

Stampt Cr.	Crowns.	Stampt Cr.
If 42	100	2000
	2000	

$$42)2000000(4761.905 \text{ Fr. Crowns.}$$

Multiply .004 = $\frac{2}{3}$ per Cent. his Commission.

The Commission 19.047620 to be subtracted.

Re-

Remains 4742.8574 Crowns,
to be remitted to *Naples*, at 75½ Ducats per 100

$$\begin{array}{r} 23714.2870 \\ 332000.018 \\ \hline \frac{1}{2} - 2371.4287 \end{array}$$

3580.857337 Ducats must be re-
mitted to *Naples*

according to the Commission at 42 to *Rome*, and 75½ to *Naples*.

Now, for the Amount at 41.53642 Crowns to *Rome*,
and at 74⅔ Ducats to *Naples*.

St. Crowns. Crowns. St. Crowns.
41.53642 — 100 — 2000

41.53642)200000(4815.051 Crowns
Mult. .004 as before.

Commission 19.260204 which subtract.

Remains 4795.7908 Crowns.
at 74⅔ Ducats, per 100

$$\begin{array}{r} 19183.1632 \\ 335705.356 \\ \hline \frac{1}{3} 1598.5969 \\ \frac{2}{3} 1598.5969 \end{array}$$

3580.85713 Ducats as before.

Hence it is evident that the Commission may be performed according to the two last Courses, that is, at 41.53642 Crowns to *Rome*, and 74⅔ Ducats to *Naples*.

Exam.

Examples for finding the Par of Exchange.

France negotiates with Amsterdam at 54½ d. per Ecu, and with London at 30½ per Ecu. At what must the Exchange be between Amsterdam and London to be Par with the above Courses.

Answer, at 84½ Grotes the Course between *Antwerp* and *Leghorn*.

S E C T. XVII. Compound Arbitrations.

Amsterdam hath Orders to remit a certain Sum to *Cadiz*. At the Time of this Order, *Amsterdam* can remit to *Cadiz* at 94½ d. per Ducat, (of 375 Marvedies) and *London* to *Cadiz* at 38 d. per Piaſtre, (of 272 Marvedies). The

Query

178 *Compound Arbitration of Exchanges.*

So that *Amsterdam*, by remitting by the Way of *London* at $93\frac{1}{2}$ *d. per Ducat*, instead of remitting directly at $94\frac{1}{2}$ *d. per Ducat*, gains by the Negotiation, including Commission, &c. about 1 per Cent.

By the Work of this Question it plainly appears, that *Compound*, as well as *Simple* Arbitrations, may be done by the *Rule of Three*; but as this Method is somewhat tedious in the former, I shall next shew the *general Rule* (which is deduced from the Rule of Three) for answering all Questions in *Compound Arbitrations*, and also Questions concerning the *Comparisn of Weights and Measures*.

In order to shew how this Rule is derived from the *Rule of Three*, let the first Term in each Stating of the last Example be called an Antecedent, and the last Term in each Stating, with the middle Term in the first, be called a Consequent: Then it is easy to conceive, that the Product of all the Consequents multiplied together, and divided by the Product of the Antecedents, will be the Answer required; which is a *general Rule* for all Questions in *Compound Arbitrations*, &c.

But for the ready placing of the Terms, observe the following Directions, viz.

1. Place the Antecedents and Consequents in two Columns, the Antecedents in a Column on the Left-hand, and the Consequents on the Right.

2. The first Antecedent must be of the Species of the Place that gives a certain Sum in Exchange, and of which the Par or Equality is sought, and the first Antecedent and last Consequent must always be of the same Species.

3. The first Consequent and second Antecedent must be the same; likewise the second Consequent and third Antecedent; also the third Consequent and fourth Antecedent. Which Order must be observed throughout the whole.

Last, The Terms being thus disposed, then (agreeable to the *general Rule* above mentioned) multiply all the Antecedents together, and all the Consequents together, and divide the Product of the Consequents by the Product of the Antecedents, and the Quotient will be the Answer.

These Directions being observed, the last Example being to find how many Grotes of *Amsterdam*, one *Spanish Ducat*

Ducat of 375 Marvedies will amount to by the Way of London, it will stand thus,

Antecedents. *Consequents.*

If 272 Marvedies = 38 Pence *Sterl.*
 And 240 Pence *Sterl.* = 35 s. 10 d. = 430 d. *Amst.*
 How much Money of *Amst.* = 375 Marvedies.

First, $272 \times 240 = 65280$ the Divisor,

And $38 \times 430 \times 375 = 612750$ the Dividend.

Then $65280 \overline{) 612750} (93\frac{564}{512}$, or $93\frac{11}{16}$ Grotes, nearly, as before.

That is, $93\frac{11}{16}$ Grotes is an Antecedent, or equal to 375 Marvedies, the Answer required.

This Rule is the more useful, as the Work may frequently be contracted, by dividing any of the Antecedents and Consequents by any Number or Numbers that will divide both, leaving no Remainder; which is founded upon this *Axiom*, that equal Numbers, divided by equal Numbers, their Quotients will be equal; and it is plain in the last Question, that if the Answer $93\frac{564}{512}$ Grotes be placed as an Antecedent to 375; that then the Product of all the Antecedents must be equal to the Product of all the Consequents, and therefore (by the above Axiom) any of the Antecedents and Consequents being divided by the same Number, the Product of the respective Quotients will be equal; and hence also it is obvious, that if any of the Antecedents has a like Number with any of the Consequents, such Number may be cancelled in both.

To apply this to the last Question, place *A* over the Antecedents, and *C* over the Consequents.

180 *Compound Arbitration of Exchanges.*

$$\begin{array}{r} A. \\ 2)272 \\ \hline 136 \\ \\ 3)240 \\ \hline 8 \end{array}$$

$$\begin{array}{r} C. \\ 2)38 \\ \hline 19 \\ \\ 430 \\ \\ 3)375 \\ \hline 125 \end{array}$$

Here the Antecedent 272 and Consequent 38 are divided by 2. The Antecedent 240, and Consequent 430 are divided by 10. And the Antecedent 24, and Consequent 375 by 3. And the Quotients collected out will stand as follows.

If 136 Mardevies $= 19$ Pence *Sterl.*
And 8 Pence *Sterl.* $= 43$ Grotes *Am^{ter}.*
How many Grotes in 125 Marvedies.

Then $19 \times 43 \times 125 = 102125$ the Dividend.

And $136 \times 8 = 1088$ $102125 \div 1088 = 93\frac{241}{8}$ nearly, as before.

A Banker in *Paris* remits to his Factor in *Amsterdam* 455 Crowns *Tournais*, first to *London*, at 30 *d.* per Crown; from *London* to *Rome* at 65 *d.* per Stamp Crown; from *Rome* to *Venice* at 100 Stamp Crowns, for 140 Ducats Banco; from *Venice* to *Leghorn* at 100 Ducats Banco, for 100 Piaſtres of *Leghorn*; and from *Leghorn* to *Amsterdam* at 86 Grotes per Piaſtre: The Question is, how many Guilders Banco will be received at *Amsterdam*, no Deduction being made for Charges?

	2)4(2

How

How many Pounds will weigh 548 *Amsterdam*?

$$\begin{array}{r} 2 \\ \hline 1096 \\ 7 \\ \hline 7672 \\ 3 \\ \hline \end{array}$$

$5 \times 5 = 25$) $23016(920\frac{1}{5}$ *lb.* of *Milan*, the Answer.

An Example of Measures.

Suppose that 9 Yards of *London* be equal to 7 Ells of *France*, and 7 Ells of *Holland* to 4 Ells of *France*, and that 1 Ell of *Holland* be equal to $1\frac{1}{5}$ Ell of *Hamburg*: How much *Sterling* will 81 Yards Cloth cost in *London* at 3 *l.* *Sterling* for 7 *Hamburg* Ells?

Note, If there be a Fraction in any of the Numbers, both the Antecedent and Consequent must be multiplied by the Denominator of the said Fraction, so that if 1 Ell of *Holland* be equal to $1\frac{1}{5}$ Ell of *Hamburg*; 5 Ells of *Holland* will be equal to 6 Ells of *Hamburg*.

9) 9 Yards *London* - 7 Ells *France*

$\frac{1}{2}$) 4 Ells *France* - 7 Ells *Holland*

$\frac{2}{5}$ Ells *Holland* 2) 6 Ells *Hamburg*

7 Ells *Hamburg* $\frac{3}{3}$ *l.* *Sterling*

How much *Sterling* for 81 Yards *London*

$9 \times 7 \times 3 \times 3 = 567$ the Dividend.
 $2 \times 5 = 10$) $567 (= 56 \text{ l. } 14 \text{ s. the Answer.}$

I might here insert Tables of foreign Weights and Measures, but choose rather to refer those who may want to be acquainted with them, to the Universal Tables of the Weights and Measures of the World, lately published by Mr. *Parave*.

C H A P. IX.

Shewing the Nature and Construction of DECIMAL TABLES of INTEREST, and their Use in answering Questions in SIMPLE and COMPOUND INTEREST, Annuities, &c. also, Annuities on Lives.

THE Manner of working *Interest* by the Pen was shewn in *Chap. 7.* and it was there observed, that the most easy and expeditious Method of answering Questions both in *Interest* and *Annuities* is by *Tables*: I shall therefore in this *Chap.* shew the *Construction* and *Use* of *Tables* for that Purpose.

S E C T. I. Simple INTEREST.

By *Table 1.* (which begins a few Pages forward) is found the *Simple Interest* of any Sum to 10000 *l.* for any Number of *Days* at 5 *per Cent.* and by *Table 2.* the *Interest* of any Sum whatever for any Number of *Years* to 40 at the same *Rate.*

And the *Interest* being found at 5 *per Cent.* may with the greatest Ease be known at any other usual *Rate*, as 3, 3½, 4, &c. without *Tables* of different Rates, as I shall shew hereafter.

The Numbers in the respective Columns of the *first Table*, shew the *Interest* from 1 *l.* to 9, (expressed in the decimal Parts of a Pound) for the *Days* in the first Column against which they stand. And in like Manner the Numbers in the *second Table*, shew the *Interest* for *Years.*

It is needless to say any Thing here of the *Excellency* of *Decimal Tables* of *Interest* beyond those which express the interest in common Money, as their superior Use will ap-

pear in the Manner of using them, but first of their *Construction*.

The *first* Number in the Column under 1 *l.* Table 1. being the *Interest* of 1 *l.* for a *Day*, at 5 *per Cent.* is found by only dividing .05 *l.* the *Interest* of 1 *l.* for a *Year* (at that Rate) by 365, and the *Quotient* to six Places of Decimals will be found .000136 with a Remainder of 360, which may stand thus, .000136³⁶⁰/₃₆₅, which is the exact *Interest* of 1 *l.* for a *Day* at 5 *per Cent.* and the *Vulgar Fractional Part* being abbreviated, it will be .000136²/₃, and this being continually added in the Manner directed (Page 55) for making the *Decimal Tables* of *Weight* and *Measures* will constitute the first Column next to that of *Days*. And the *first* Numbers in the Columns under 2 *l.* 3 *l.* 4 *l.* &c. to 9 *l.* are the 2d, 3d, 4th, &c. Numbers in the first Column. And by continually adding the *first* Number of each Column, the whole *Table* is constructed.

As to the *Construction* of the *second Table*, it is just similar to the *first*; the *first* Column next to that of *Years* being made, by continually adding the *Interest* of 1 *l.* for a *Year*; and the *second* Column by continually adding the *Interest* of 2 *l.* for a *Year*, and so on for every Column.

I come now to shew the *Use* of these *Tables*; first, when the *Rate* of *Interest* is 5 *per Cent.* (at which they are calculated) and then at any other *Rate*.

The Use of the Tables of Simple Interest.

In order to make these *Tables* universally useful, the Reader is to observe, that if a Number consists of only one Digit with Cyphers affixed, as 10, 50, 700, 9000, &c. 'tis called a *pure Number*; but those Numbers which consist of more than one, or wholly of Digits, as 370, 568, 7569, &c. may be called *Mixed Numbers*. Now every *Mixed* Number may be resolved into those *pure Numbers*, of which it is composed; thus the *Mixed* Number 567, may be resolved into the *pure* Numbers 500, 60, and 7; so also 15890 is resolved into 10000, 5000, 800, and 90.

This being premised, observe these *Directions*,

1. If the Sum whose *Interest* is required be a *Mixed Number*, let it be resolved into *pure Numbers*.

B b 2

2. With

2. With the *pure* Numbers severally enter the Tables, and in those Columns marked at the Top with the Digits of each *pure* Number, take out those *Decimal Numbers* which stand even with the Number of *Days* or *Years*, for which the Interest is required.

3. Remove the *Decimal point* in each such *Decimal Number* so many Places to the *right-hand*, as there are *Cyphers* in the respective *pure* Numbers.

4 Lastly, Add together all the *Decimal Numbers* and their *Sum* will be the Interest at 5 per Cent.

EXAMPLE I.

What's the Interest of 528*l.* for 96 Days, at 5 per Cent.

		<i>Decimals</i>	
In <i>Table</i> 1. even with 96 days, you find under the <i>pure</i> Numbers.	{	500 -	6.5753
		20 -	.2630
		8 -	.1052
			<hr/>
The Answer		6.9435	<i>l. s. d.</i> = 6: 18: 10½

EXAMPLE II.

What's the Interest of 436*l.* 7*s.* 6*d.* for 253 Days, at 5 per Cent.

It was observed, Page 105, &c. that *two places* of *Decimals* are sufficient for the Shillings and Pence, in a Sum whose Interest is required for no greater Time than a *Year*, and *three Decimal places* in finding the Interest for *Years*. And

The above Sum expressed Decimally to *two places* will be the *mixed* Number 436.37*l.* which being resolved will stand thus,

In <i>Table 1.</i> even with 253 Days, you find under the <i>pure</i> Numbers.	{	400. -	13.863	
		30. -	1.0397	
		6. -	.2079	
		.3 -	.0103	
		.07 -	.0024	
			<hr/>	<i>l. s. d.</i>
Answer		15.1233	= 15 : 1 : 5½	Note

Note, The Decimal of a *mixed* Number, being resolved into *pure Decimal* Numbers, the Reader must observe, that in taking out the Interest of the *Decimal Numbers* to move the Decimal point so many Places to the *Left-hand*, as there are Places in the *said Numbers*, as in the last and following Example.

EXAMPLE III.

What's the Interest of the last Sum 436*l.* 7*s.* 6*d.* for 18 Years at 5 *per Cent.*

The Interest here being for *Years*, requires the Decimal for the odd Money to *three* Places. The above Sum is exactly equal to 436.375*l.* which resolve as before.

In Table 2, even with 18 Years, you find under the <i>pure</i> Numbers.	{	400.	-	360.			
		30.	-	27.			
		6.	-	5.4			
		.3	-	.27			
		.07	-	.063			
		.005	-	.0045			
				<hr/>	<i>l.</i>	<i>s.</i>	<i>d.</i>
Answer				392.7375	=	392	: 14 : 9

These Examples shew the Use of the Tables when the *Rate* of Interest is 5 *per Cent.* I shall next give two short general Rules for finding the Interest at any other *Rate.*

Rule 1. If the *Rate* be *Pounds*, or *Pounds and half-Pounds*, which are the most usual Rates of Interest. First, find by the *Tables* the Interest at 5 *per Cent.* which multiply by as many *Tenths* as there are half-pounds in the given *Rate*, the *Product* will be the Interest required. Thus if the *Rate* be 3 *per Cent.* multiply by .6, if 3 $\frac{1}{2}$, multiply by .7, &c.

Rule 2. If there are *Quarters* in the given *Rate* (but this is seldom the Case) multiply the Interest found at 5 *per Cent.* by as many *Hundredths* as there are *Shillings* in the said *Rate*, the *Product* will be the Answer. Thus if the *Rate* be 3 $\frac{1}{4}$, multiply by .65 ; if 3 $\frac{3}{4}$, multiply by .75, &c.

EXAMPLE

EXAMPLE IV.

What's the Interest of 9430*l.* for 63 Days at 4 *per Cent.*

In Table 1. even with $\left\{ \begin{array}{l} 9000 - 77.671 \\ 63 \text{ Days, you find under } 400 - 3.4521 \\ \text{the pure Number. } 30 - .2589 \end{array} \right.$

The Int. at 5 *per Cent.* 81.3820
Then *per Rule 1*, mult. by $\frac{.8}{\text{the half-pounds in the Rate being 8.}}$

The Int. at 4 *per Cent.* 65.10560 = 65*l.* 2*s.* 1*d.*

EXAMPLE V.

What's the Interest of 875*l.* 12*s.* = 875.6*l.* for 21 Years at 3½ *per Cent.*

In Table 2. even $\left\{ \begin{array}{l} 800. - 840. \\ \text{with 21 Years, you } 70. - 73.5 \\ \text{find under. } 5. - 5.25 \\ .6 - .63 \end{array} \right.$

The Int. at 5 *per Cent.* 919.38
multiply by $\frac{.7}{\text{per Rule 1.}}$

The Int. at 3½ *per Cent.* 643.566 = 643*l.* 11*s.* 3¼*d.*

EXAMPLE VI.

What's the Interest of 672*l.* for 126 Days, at 4¼ *per Cent.*

In Table 1. even $\left\{ \begin{array}{l} 600 - 10.3562 \\ \text{with 126 Days, you } 70 - 1.2082 \\ \text{find under. } 2 - .0345 \end{array} \right.$

The Int. at 5 *per Cent.* 11.5989
mult. by $\frac{.85}{\text{per Rule 2.}}$

579965
927912

The Int. at 4¼ *per Cent.* 9.859065 = 9*l.* 17*s.* 2¼*d.*

It is plain by the 4th and 5th Examples, that the Interest of any Sum (under 10000*l.* if required for Days) may be almost or quite as readily found at the most *usual Rates* by means of *these Tables* calculated only at 5 *per Cent.* as by *common Tables* of Interest, which if calculated at different Rates, *i. e.* at 3, 3', &c. to 5 *per Cent.* would be fifteen times as large; indeed when there are *Quarters* in the *Rate* (as in the last Example) the Interest is not quite so readily found, the Multiplication being something larger, but this I believe seldom or never happens, except when the Interest is required for *just a Year*, as in the 3d Example of the 7th Chap. and the Interest of any Sum for a *Year*, I think in general may be found very near or quite as soon by the Methods there taught as by any Tables whatever.

To the two Tables of Simple Interest, might be added a third for finding the present Worth or Discount of any Sum; but as the customary Method of discounting a Sum, is by finding the Interest thereof, a Discount Table (at Simple Interest) is not necessary.

It being often wanted in Questions relating to *Time*, but particularly in the whole affair of *Interest* to know the *Number of Days* from one Time to another, it will be here proper to insert a useful Table for that Purpose.

A Table

A Table of Days for any given Time.

Days.	January.	February.	March.	April.	May.	June.	July.	August.	September.	October.	November.	December.
1	1	32	60	91	121	152	182	213	244	274	305	335
2	2	33	61	92	122	153	183	214	245	275	306	336
3	3	34	62	93	123	154	184	215	246	276	307	337
4	4	35	63	94	124	155	185	216	247	277	308	338
5	5	36	64	95	125	156	186	217	248	278	309	339
6	6	37	65	96	126	157	187	218	249	279	310	340
7	7	38	66	97	127	158	188	219	250	280	311	341
8	8	39	67	98	128	159	189	220	251	281	312	342
9	9	40	68	99	129	160	190	221	252	282	313	343
10	10	41	69	100	130	161	191	222	253	283	314	344
11	11	42	70	101	131	162	192	223	254	284	315	345
12	12	43	71	102	132	163	193	224	255	285	316	346
13	13	44	72	103	133	164	194	225	256	286	317	347
14	14	45	73	104	134	165	195	226	257	287	318	348
15	15	46	74	105	135	166	196	227	258	288	319	349
16	16	47	75	106	136	167	197	228	259	289	320	350
17	17	48	76	107	137	168	198	229	260	290	321	351
18	18	49	77	108	138	169	199	230	261	291	322	352
19	19	50	78	109	139	170	200	231	262	292	323	353
20	20	51	79	110	140	171	201	232	263	293	324	354
21	21	52	80	111	141	172	202	233	264	294	325	355
22	22	53	81	112	142	173	203	234	265	295	326	356
23	23	54	82	113	143	174	204	235	266	296	327	357
24	24	55	83	114	144	175	205	236	267	297	328	358
25	25	56	84	115	145	176	206	237	268	298	329	359
26	26	57	85	116	146	177	207	238	269	299	330	360
27	27	58	86	117	147	178	208	239	270	300	331	361
28	28	59	87	118	148	179	209	240	271	301	332	362
29	29		88	119	149	180	210	241	272	302	333	363
30	30		89	120	150	181	211	242	273	303	334	364
31	31		90		151		212	243		304		365

The Use of the Table.

First, To know the *Number of Days* from the *End of the Year*, to any given *Day*, of any *Month* in the *Year* following.

This is obtained by Inspection only; thus from December the 31st, to September the 7th following is 250 Days: To November the 27, are 331, &c.

Secondly, To know what is the *Number of Days* from any given *Day* of any *Month* to the *End of the Year*.

Suppose September the 7th, then from ——— 365
Subtract the Number answering to September 7. 250

There remains the *Number of Days* fought, viz. 115 Days

Thirdly, To find the *Number of Days* between the given *Day* of any one *Month*, and any given *Day* of any other *Month* in the *same Year*.

For Instance, to know how many *Days* there are between May the 3d, and November the 17th.

Thus, from the Number answering to November 17th. 321
Subtract that answering to May 3d. ——— 123

The *Remainder* is the *Number of Days* fought 198

Fourthly, To find the *Number of Days*, from any given *Day* of any *Month* in one *Year*, to any given *Day* of any *Month* in the *next Year*.

How many *Days* is it from the 20th of October 1756, to the 19th of March, 1757.

From the *Days* of the whole Year ——— 365
Subtract the Number to October 20 ——— 293

Remains the Number to the End of the Year 72
To which add the Number to the 19th of March 78

The *Sum* is the *Number of Days* required ——— 150
C c And

And thus is the *Num'er of Days* readily found for any *Interval of Time* given, in the same Year ; or which is part of one, and part of another Year. But it must be observed in *Leap Year*, that if one of the given Days (between which the Number of days is required) is before the 29th of February and the other after, to add one day more on that account : Thus if the Number of days required, instead of being from the 20th of October 1756, to the 19th of March 1757 (as in the last Example) had been from the 20th of October 1755 to the 19th of March 1756, it would have been 151 Days.

S E C T. II.

Compound INTEREST, Annuities, &c.

What *Compound Interest* is, has been already defined. And *Annuities, Pensions, Salaries, &c.* are *Rents, Profits,* and *Payments,* made *Yearly,* or *half-yearly,* &c. And they are said to be in *Arrears,* when they are due and unpaid for any Number of Payments.

In order to solve Questions in *Compound Interest* and *Annuities* by *Tables,* I have hereafter inserted 6 *Tables* of *Compound Interest* for that Purpose, the Nature of which may be seen by the Titles of them; I shall therefore begin with their *Construction.*

As to the *Construction* of the *second* Table, which shews the *Amount* of 1*l.* for *Years,* at the *Rates* therein mentioned, (as the *first* Table does for *Days*) I need only refer the Reader to the 2nd *Example* in the 1st *Case* of *Compound Interest,* (Page 122) where the *Amount* of 1*l.* at 4 per Cent. is found for 1, 2, and 3 *Years;* and after the same manner, the *Amount* of 1*l.* is found as in the Table, from 1 Year to 40, at each *Rate* therein.

The *Construction* of the *first* Table is *analogous* to the *second,* for as the *second* is constructed by continually multiplying by the *Amount* of 1*l.* for a Year, so the *first* Table is constructed by continually multiplying by the *Amount* of 1*l.* for a Day. And the *Amount* of 1*l.* for a Day, is the *Root* of the *Amount* of 1*l.* for a Year extracted to the 365th *Power,* which here must be taken for granted to be as expressed in the Table, where you will find the *Amount* of 1*l.* for a Day at 5 per Cent. to be, 1.0001336, and 1.0001336 the *Amount* of 1*l.* for 1 Day, multiplied by .0001336

Product 1.0002673 the *Amount* of 1*l.* for 2 Days.

And 1.0002673 the Amount of 1*l.* for 2 Days.
 mult. 1.0001336

Product 1.0004011 the Amount of 1*l.* for 3 Days.
 mult. 1.0001336

Product 1.0005348 the Amount of 1*l.* for 4 Days.

And thus by continually multiplying by the *Amount of 1*l.* for a Day*, at each *Rate per Cent.* the 1st Table is constructed; and the 3 4th *Product* will be the *Amount of 1*l.* for a Year*.

The 2d Table is constructed by dividing *Unity* by the *Numbers* in the 2nd Table; the respective *Quotients* are the *Numbers* in the 3d.

The Reason of which is evident from the 2nd *Case of Compound Interest*. To make this appear, let the present Worth of 1*l.* be required, due 1 Year hence at 5 per Cent. Here 1*l.* is to be considered as the *given Amount*, and therefore by the 2nd *Rule* of the abovementioned *Case* it will be.

As 1.05*l.* : 1*l.* :: 1*l.* : .9523809 the present Worth or Principal required.

Hence 'tis plain that the fourth Term, which is the *first* Number in the 3d Table under 5 per Cent. is the Result of *Unity* divided by 1.05, which is the *first* Number in the 2nd Table under the same *Rate*.

In like manner in finding the present Worth of 1*l.* for any Number of Years to 40 at 5 per Cent, the first Term in each Proportion will be the Number in Table 2. standing against the said Year, and under that *Rate*, and the second and third Terms will always be *Unity*. And consequently *Unity* being divided by each Number in the 2nd Table under any *Rate per Cent.*, the respective *Quotients* will be the Numbers in the 3d Table under the same *Rate*.

Example at 5 per Cent.

	Table 2		Table 3.	
Unity, or 1	1.05	The Quotient is	.9523809	The present Value of 1 <i>l.</i> for
divided by	1.1025		.9070295	1
	1.157625		.8638376	2
	1.2155063		.8227025	3
	1.2762816		.7835262	4
				5 Years, &c.

The 4th Table (which shews the *Amount* of 1*l.* Annuity for Years) may be constructed two or three ways, but the Reason of its Construction, and the Nature of the *Amount* of Annuities when forborn or unpaid for any Number of Years, are I think easiest conceived (except to an Algebraist) by the following Method, which is little more than an Application of the 1st Case of Compound Interest.

I'll here suppose the Amount of 1*l.* Annuity to be required for, 1, 2, 3, and so on for any Number of Years, at 5 per Cent.

First, the Amount at the Expiration of 1 Year is the Annuity itself, namely 1*l.*; and 1*l.* being put out at Interest for 1 Year at 5 per Cent. will amount to 1.05*l.* (by Case 1st, Compound Interest) to which add the Annuity, and it will be $1.05 + 1 = 2.05$ *l.* the Amount of 1*l.* Annuity for 2 Years.

Again, 2.05*l.* being put out at Interest for 1 Year at the same Rate, the Amount (by Case 1 as before) will be equal to $2.05 \times 1.05 = 2.1525$. And $2.1525 + 1$ (the Annuity) = 3.1525 *l.* the Amount of 1*l.* Annuity for 3 Years.

Once more, the Amount of 3.1525*l.* for 1 Year at the said Rate, will be equal to $3.1525 \times 1.05 = 3.310125$. And $3.310125 + 1 = 4.310125$ *l.* the Amount of 1*l.* Annuity for 4 Years.

The above Work may stand thus.

Table 4.

First, the Annuity	= 1.000000	} The Am ^t . of 1 <i>l.</i> An- nuity for	{	1
and	$1 \times 1.05 + 1 = 2.050000$			2
next	$2.05 \times 1.05 + 1 = 3.152500$			3
lastly	$3.1525 \times 1.05 + 1 = 4.310125$			4 Years, &c

And thus may the whole Table be constructed at every Rate per Cent, namely by continually multiplying by the Amount of 1*l.* for a Year, adding 1 to every Product.

I have already hinted at the Reason for shewing this Method of constructing the 4th Table, to wit, that the Learner may see the Nature of the Amount ^{of Annuities} in Arrears, and

and the Reason of the Construction; but a shorter Method of constructing the same is to add together the Numbers in the 2nd and 4th Tables, standing against the same Years, and under the same Rate (as the first Number in each Column of Table 4, is always 1.) and the Sum of any two such Numbers will be the next Number in Table 4.

Example at 5 per Cent.

Table 2. Table 4.

1.05	1.000000	The Am ^t . of 1 ^l An- nuity for	$\left. \begin{array}{l} 1 \\ 2 \\ 3 \\ 4 \end{array} \right\}$
1.1025	2.050000		
1.157625	3.152500		
1.2155063	4.310125		

4 Years, &c.

Here the first Number in Table 4th, namely 1, added to 1.05, the first Number in Table 2nd. the Sum is 2.05, the second Number in Table 4th, which second Number 2.05 added to 1.1025 the second Number in Table 2nd. the Sum is 3.1525 the third Number in Table 4th. And after this manner may the whole Table be constructed at each Rate therein.

The Reason of the Construction of Table 5th, will best appear from the following Method of constructing it, namely, to divide the Numbers in the 4th Table by the Numbers in the 2nd, standing against the same Years and under the same Rate, the Quotients will be the Numbers in the 5th.

Example at 5 per Cent.

Table 2. Table 4. Table 5.

1.05	1.000000	(=0.9523809	The Pref ^t . worth of 1 ^l . Ann. for	$\left. \begin{array}{l} 1 \\ 2 \\ 3 \\ 4 \end{array} \right\}$
1.1025	2.050000	(=1.8594104		
1.157625	3.152500	(=2.7232480		
1.2155063	4.310125	(=3.5459505		

&c.

And thus for any other Rate of Interest.

This

This (as well as the Construction of *Table 3d*) is deduced from the 2nd *Case of Compound Interest*, as will appear by considering first, that every Number in the 5th *Table*, is the present Worth or Principal of that Sum or Number in the 4th *Table* which stands against the same Years. Suppose therefore, that the present Worth of 2.05*l.* (the *second* Number in the 4th *Table* under 5 *per Cent.*) be required for 2 Years at 5 *per Cent.* This by *Case. 2* of *Compound Interest*, will be. As 1.1025*l.* : 1*l.* :: 2.05*l.* : 1.859410 *l.* which is the *second* Number in *Table 5* under that *Rate*. And as the *first* and *third* Terms in the Proportion are the *second* Numbers in the 2nd and 4th *Tables*, it plainly appears that the foregoing Method of constructing the *Table* is deduced from the 2nd *Case of Compound Interest*.

But this also as well as *Table 4*, may be constructed by a shorter Method, for any Number in the 5th *Table*, added to the Number in the 3d, standing against the next Year (and under the same *Rate*) the Sum is the next Number in the 5th *Table* (the first Number of each Column in *Table 5*, being the same with the first Number of each Column in *Table 3*.)

Example at 5 *per Cent.*

Table 3. Table 5.

.9523809	0.9523809	The Present Worth of 1 <i>l.</i> Ann. for	1
.9070295	1.8594104		
.8638376	2.7232480		
.8227025	3.5459505		
			2
			3
			4 Years, &c.

Here the first Number in *Table 5th*, added to the 2d Number in *Table 3d*, the Sum is 1.8594104 the 2nd Number in *Table 5*, which 2nd Number added to the 3d Number in *Table 3*, the Sum is 2.7232480 the 3d Number in *Table 5*. And thus may the whole *Table* be constructed at each *Rate* of Interest.

Table 6, is constructed by dividing *Unity* by the Numbers in the 5th *Table*, the *Quotients* will be the Numbers in the *sixth*; for as the Numbers in the 5th *Table* shew what must

E e

be

be given for *l.* Annuity for the Years against which they stand; it is therefore obvious that the Numbers in the 6th (which shew the Annuity that *l.* will purchase) may be found by this Proportion, namely, As any Number in the 5th Table, is to Unity; so is Unity, to the Number in the 6th, standing against the same Years, and under the same Rate; and as Unity or 1, will always be the 2nd and 3d Terms in the Proportion, it follows, that the Numbers in the 6th Table, are the Result of Unity divided by the Numbers in the 5th.

Example at 5 per Cent.

Table 5.

Table 6.

Unity or 1 divided by	{ 0.9523809 1.8594104 2.7132480 3.5459505 }	The Quot.	is	{ 1.05 .5378049 .3672086 .2820118 }	The Ann. l. will pur- chase for	{ 1 2 3 4 }	Years, &c.
--------------------------	--	-----------	----	--	---------------------------------------	----------------------	---------------

The Use of the following Tables.

The Use of all these Tables, except in the 8th, 9th, and 10th Examples, depends on this one obvious and easy *General Rule*.

Multiply the Tabular Number which stands against the given Number of Days or Years, and under the given Rate of Interest, by the *given Sum*; and the Product will satisfy the Question.

EXAMPLE I.

What will 358*l.* Amount to in 40 Days, at 5 per Cent. per Annum, Compound Interest?

In Tab. 1, against 40 Days, under 5 per C. stands, 1.0053611

Which multiplied by the *given Sum* 358

The Product is the *Amount* required, viz. *l.* 359.9192738

If the *Amount* of any *Principal* be sought for a *Number* of *Days* which are not in the *Table*: Divide the given *Number* of *Days* into two such *Numbers* as are in the *Table*, and multiply the *Amounts* answering thereto, into each other, and that *Product* by the *Principal*, which will give the *Amount* required.

EXAMPLE II.

What's the *Amount* of 523*l.* in 194 *Days* at 5 *per Cent*?

The two *Parts* of this *Number* in the *Table* are 190, and 4; and

the *Amount* of 1*l.* for $\left\{ \begin{array}{c} 190 \\ 4 \end{array} \right\}$ *Days* at 5 *per. C.* $\left\{ \begin{array}{c} 1.0257228 \\ 1.0005348 \end{array} \right.$

Then $1.0257228 \times 1.0005348 = 1.0262714$ *l.* the *Amount* of 1*l.* for 194 *Days*, which multiplied by 523, the *Product* is 536.7399 &c. = 536*l.* 14*s.* 9*d.* the *Amount* required.

EXAMPLE III.

What will 425*l.* amount to in 21 *Years* at 4 *per Cent. per Annum.*

In *Table 2.* Against 21 *Years* & under 4 *per C.* is 2.2787681
Which multiplied by ————— 425

The *Product* is the *Amount* required *l.* 938.4764 &c.

If the *Amount* be required for any *Number* of *Years* exceeding those in the *Table*, and under 80, proceed with the *Years* as with the *Days* in the 2nd *Example*.

EXAMPLE IV.

What's the *Amount* of 100*l.* for 75 *Years*, at 4 *per Cent*?

First, the *Amount* $\left\{ \begin{array}{c} 40 \\ 35 \end{array} \right\}$ *years* at 4 *per Cent.* is $\left\{ \begin{array}{c} 4.8010206 \\ 3.9460889 \end{array} \right.$
of 1*l.* for

Then $4.8010206 \times 3.9460889 = 18.945254$ *l.* the Amount of *1l.* for 75 Years, which multiplied by 100, the Product is $1894.5254 = 1894$ *l.* 10*s.* 6*d.* the Amount required.

If the Amount be required for any Number of Years above 80; for Instance, Suppose the Amount of *1l.* were required for 99 Years at 4 per Cent; first multiply the Amount of *1l.* for 40 Years at the said Rate by itself, and the Product will be the Amount of *1l.* for 80 Years, which multiplied by the Amount of *1l.* for 19 Years, the last Product will be found *l.* 48.5624 &c. the Amount required. Again, suppose the Amount of *1l.* were required for 170 Years at the same Rate: multiply the Amount of *1l.* for 80 Years (found as above directed) by itself, and the Product will be the Amount of *1l.* for 160 Years, which multiplied by the Amount of *1l.* for 10 Years, will give the Amount of *1l.* for 170 Years = *l.* 786.4437 &c. Whence it is easy to conceive that by means of the 2nd Table, the Amount of any Sum may be found for any Number of Years whatever. But it may be proper to observe that when the Years exceed the Table, a more easy way (to them who know their Use) is to work by *Logarithms*.

And here, as I have just mentioned an Instance wherein *Logarithms* are useful, it may not be unacceptable to those of my Readers who are not acquainted with them, to be informed further of their Use: By the admirable Art of *Logarithms* then (which was at first invented by the Lord Neiper, Baron of Merchiston in Scotland, and first published at *Edenburgh*, in the Year 1614) *Multiplication* and *Division*, are performed by *Addition* and *Subtraction* only of two *Logarithmic* Numbers; and *Involution* (which is a continual Multiplication of a Number first multiplied into itself) by one Operation only in *Multiplication*; and *Evolution* or *Extraction of Roots*, by one Operation in *Division*. Hence they are of great use in Extracting the *Square*, *Cube*, &c. *Roots*, and in solving Questions in *Compound Interest*, but more particularly in all *Trigonometrical* Calculations; but as they are not immediately necessary in *Compound Interest* (for I am shewing how the most useful Questions therein may easily be done without them) nor in any
Mercantile

Mercantile Computations, I have therefore not introduced them in this Treatise. But to proceed :

To find the *Amount* of a Sum for Years and Days, work as in the following Example.

E X A M P L E V.

What will 523*l.* amount to in 5 Years and 194 Days, at 5 per Cent.

First. In *Table 2*, against 5 Years at 5 per Cent. is 1.2762816; and the Amount of 1*l.* for 194 Days, is 1.0262714 as per 2d *Example*.

Then, $1.2762816 \times 1.0262714 = 1.3098113$ *l.* the Amount of 1*l.* for 5 Years and 194 Days, which multiplied by 523 the Principal, the Product is 685.0313 &c. = 685*l.* 0*s.* 7½*d.* the *Amount* required.

E X A M P L E VI.

What's the *present Worth* of 968*l.* 9*s.* 6*d.* = 968.476*l.* due 21 Years hence at 4 per Cent per Annum?

In *Table 3*, against 21 Years at 4 per Cent. is .4388336
Which multiplied by ———— 968.476

The Product is the *present Worth* required l. 425.

Note, This is the *Reverse* of *Example 3*.

In finding the *present Worth* of a Sum when the Years exceed the limits of the Table, proceed in a similar manner to *Example 4*. The following is the *Reverse* of it.

E X A M P L E VII.

What is the *present Worth* of 1894*l.* 10*s.* 6*d.* = 1894.525*l.* due 75 Years hence, at 4 per Cent.?

First,

First, the present Worth of 1*l.* for $\left. \begin{array}{l} 40 \\ 35 \end{array} \right\}$ Years at 4 *per Cent.* is $\left. \begin{array}{l} .2082893 \\ .2534155 \end{array} \right\}$

And, $.208289 \times .2534155 = .0527837$ *l.* the present Worth of 1*l.* for 75 Years, which multiplied by 1894.525 the Product is 100*l.* the *present Worth* or *Principal* required.

It was shewn after *Example 4.* how the *Amount* of a Sum might be found for any Number of Years whatever, and after the like manner, by *Table 3*, the *present Worth* of a Sum for any Number of Years may also be found: But the other Tables relating to *Annuities* cannot be extended in this manner, nor do they but seldom require it.

If the *present Worth* of a Sum be required for Years and Days; first, find the *Amount* of 1*l.* at the *Rate* and *Time* given by *Tables 1* and *2*; by which divide the given *Amount*, and the *Quotient* will be the *present Worth* or *Principal* required, as in this *Example*.

E X A M P L E VIII.

What *Principal* being put to Interest, will raise a Stock of 685*l.* os. 7½*d.* = 685.0313*l.* in 5 Years and 194 Days, at 5 *per Cent.*?

First, the *Amount* of 1*l.* at the *Rate* and *Time* given is, 1.3098113*l.* *per Example 5.* (of which this is the *Converse*.)

And $1.3098113 \div 685.0313 (= 523$ *l.* the *Principal* required.

E X A M P L E IX.

In what *Time* will 425*l.* raise a Stock of (or amount to) 968*l.* 9*s.* 6¼*d.* = 968.4764*l.* at 4 *per Cent.* *per Annum*.

Divide the proposed Stock (*viz.* 968.4764) by the given *Principal* (*viz.* 425) and the *Quotient* will shew the Number in *Table 2nd*, under the given *Rate* that stands against the *Time* sought. Thus $425 \div 968.4764 (= 2.2787681$, and this Number being sought in the said *Table* under 4 *per Cent.* will be found to stand against 21 Years, which is the *Time* required. But

But if the Quotient cannot be truly found in the 2nd Table, as above, then take out the next less Number, and make it a Divisor, by which divide the first Quotient, and then seek the second Quotient in Table 1, but if it cannot be truly found, in the 1st Table, take out the next less Number *there* likewise, and divide the second Quotient by it, and then seek again for the third Quotient, and the Numbers thus found in the 1st Table, will assign the Number of Days as in this Example.

E X A M P L E X.

In what Time will 523*l.* raise a Stock of 685*l.* os. 7½*d.* = 685.0313*l.* at 5 per Cent.

First, 523)685.0313(1.3098113, and the Number next less to it in Table 2, under 5 per Cent is 1.2762816 which stands against 5 Years.

Next, 1.2762 &c.)1.3098 &c.(=1.0262714, and the Number next less to it in Table 1, under the same Rate, is 1.0257228 standing against 190 Days.

Lastly, 1.0257 &c.)1.0262 &c.(=1.0005348 which stands against 4 Days. Hence the Answer is 5 Years and 194 Days.

Note, the 5 first of these Examples shew the Use of the Tables in Case 1st of Compound Interest, the 6th, 7th, and 8th in Case 2nd, and the two last in Case 3d. The three following Examples are relating to Annuities.

E X A M P L E XI.

If 50*l.* yearly Rent or Annuity be forborn or unpaid 14 Years, What will it amount to at 4 per Cent. per Annum. Compound Interest?

In Table 4, for the Time and Rate, is — 18.2919112
Which multiplied by ————— 50

The Product is the Amount required 1.914.5955600

E X A M P L E

EXAMPLE XII.

What is 50*l.* Yearly Rent to continue 14 Years, worth in ready Money, allowing 4 per Cent. Compound Interest, to the Purchaser?

In Table 5, for the Time and Rate is ——— 10.5631223
Which multiplied by ——— ——— 50

The Product is the *present Worth* required, *l.* 528.1561150

EXAMPLE XIII.

What Annuity to continue 14 Years, will 528*l.* 3*s.* 1½*d.* = 528.1561*l.* purchase, allowing 4 per Cent. Compound Interest to the Purchaser?

In Table 6, for the Time and Rate is ——— .094669
Which multiplied by ——— 528.1561

The Product is the *Annuity*, — — — *l.* 50.

To the foregoing Examples I shall next add a few Questions of a more Complex Nature, and which frequently happen, in order to shew the more extensive use of the Tables.

QUESTION I.

What is the *Value* of the *Reversion* of a *Freehold Estate*, of 50*l.* yearly Income, to commence 7 Years hence, allowing the Purchaser 4 per Cent. Compound Interest for his ready Payment?

Agreeable to the 2nd Case of purchasing Freehold Estates (Page 126) the full Value *l.*
of the said Estate, at 4 per Cent. is 1250.

By Table 5, the *present Worth* of 50*l.* per Annum for 7 Years at the said Rate may be found to be } 300.102735

The Difference is the *Value* of the *Reversion* *l.* 949.897265

Q U E S.

2. Then find (by Table 6) what *Annuity*, to continue 7 Years at the given *Rate*, 310.68*l.* will purchase; which you will find to be *l.* 51.7623 = 51*l.* 15*s.* 3*d.* the Answer

QUESTION VI.

A has a Term of 7 Years in an *Estate* of 40*l.* per *Annu*: B has a Term of 14 Years in the same *Estate* in *Reversion* after the 7 Years; and C has a further Term of 14 Years in *Reversion* after the 21 Years. Query the *present Values* of the *several Terms* at the *Rate* of 5 per *Cent.*?

By Table 5. the *present Value* of 40*l.* per *Annum* may be found

	<i>l.</i>	<i>s.</i>	<i>d.</i>
for 35 Years, to be	654	19	4
for 21 Years, to be	512	16	11
for 7 Years, to be	231	9	1

Which Subtract from each other it will appear

That the <i>present Value</i> of A's Term is	231	9	1
of B's Term	281	7	10
of C's Term	142	2	5

For these *Values* Answer the Question *l.* 654 : 19 : 4

QUESTION VII.

A Person having 12 Years to come, in a *Lease* of an *Estate* of 60*l.* per *Annum* for 40 Years, would know what *present Money* he must pay in order to *renew* or *complete* the *Lease* by adding 28 Years thereto, computing at 5 per *Cent.* *Compound Interest*?

By Table 5. the *present Value* of 1*l.* per } *l.* 17.1590862
Annum at 5 per *Cent.* for 40 Years, is }

By the same Table, the *Value* of 1*l.* per } *l.* 8.8632516
Annum at that *Rate* for 12 Years to come, is }

The difference is — 8.2958346
Which multiplied by — 60

The Product is the Answer, viz.
Ff 2

l. 497.750 &c.
QUEST.

QUESTION VIII.

What *Annuity* to continue 14 Years, may be purchased with 1000*l.* to be paid 5 Years after the *Commencement* of the *Annuity* at 5 *per Cent*?

By *Table 3*, the *present Worth* of 1000*l.* due 5 Years hence at 5 *per Cent.* may be found 783.5262 *l.* And

By *Table 6*, it may be found, that the *Annuity* which 783.5262*l.* will purchase for 14 Years at the *Rate* of 5 *per Cent.* is $79.1549 = 79 \text{ l. } 3 \text{ s. } 1 \text{ d. per Annum.}$ the Answer.

QUESTION IX.

For a *Lease* of certain *Profits* for 7 Years, A. offers to pay 150*l.* as a *Fine*, and 300*l.* *per Annum*; B offers 400*l.* *Fine*, and 250*l.* *per Annum*; C bids 650*l.* *Fine*, and 200*l.* *per Annum*: and D bids 1800*l.* *Fine* without any *Rent*: *Query* which is the best *Offer*, and what the *Difference*, computing at 4 *per Cent*?

1. By *Table 5*, the *present Worth* of 300*l.* }
per Annum for 7 Years at the said *Rate*, is } *l.* 1800.6164
 found to be
 To which add — — 150.

The Sum is the *present Worth* of A's Offer *l.* 1950.6164

2. By *Table 5*, the *present Worth* of 250*l.* }
per Annum for 7 Years at the said *Rate*, is } *l.* 1500.5136
 To which add — — 400.

The Sum is the *present Worth* of B's Offer *l.* 1900.5136

3. By *Table 5*, the *present Worth* of 200*l.* }
per Annum for the given *Time* and *Rate*, is } *l.* 1200.4109
 To which add — — 650.

The Sum, the *present Worth* of C's Offer *l.* 1850.4109

Hence

Hence it appears that A's is the *best* offer, and that (rejecting the Decimals) A bids 50*l.* more than B, 100*l.* more than C, and 150*l.* more than D, which fully Answers the Question.

QUESTION X.

What *Annuity* is sufficient to pay off a *Debt* of 90 *Millions* in 40 *Years* at 3 *per Cent.* Compound Interest?

In *Tab.* 6, against 40 *Years* & under 3 *per Cent.* is .0432624
 Which multiply by the Debt ————— 90000000

 The Product is the *Annuity* sought, viz. l. 3893616

So that supposing the *National Debt* to be 90 *Millions*, and the Interest paid to be 270000*l.* per *Annum*, or 3 *per Cent.* then would a *Sinking Fund* of 1193616*l.* per *Annum*, clear the whole *Debt* in 40 *Years*.

Note, In the foregoing Questions relating to *Annuities*, they are supposed to be payable at yearly Payments, other Tables being requisite for answering Questions when the Payments are made *half-yearly* or *quarterly*, but what has been said of the *Construction* and *Use* of these, may suffice to shew the Nature and Manner of using these calculated for *half-yearly* or *quarterly* Payments.

DECIMAL TABLES of COMPOUND INTEREST
At the Rates of 3; 3½; 4; 4½; and 5 per Cent. per Annum.

TABLE I. The Amount of one Pound for Days,

<i>Days.</i>	<i>3 per Cent.</i>	<i>3½ per Cent.</i>	<i>4 per Cent.</i>	<i>4½ per Cent.</i>	<i>5 per Cent.</i>
1	1.0000879	1.0000947	1.0001074	1.0001206	1.0001336

S E C T. III. Of Annuities upon Lives.

I shall here give the following Tables, taken from Mr. *Hodgson's Annuitiis upon Lives*, the Computation of which he deduces from the *London Bills of Mortality* for 10 successive Years from the Year 1728.

The Value of Annuities upon Lives at the Rate of 3 per Cent. per Annum.

<i>Years</i> <i>Value.</i>	<i>Years</i> <i>Value.</i>	<i>Years</i> <i>Value.</i>	<i>Years</i> <i>Value.</i>	<i>Years</i> <i>Value.</i>
1 15.3092	24 15.5185	4 11.4286	70 6.9102

19	15.1143	42	11.3189	65	7.4620	88	2.3582
20	14.8901	43	11.2262	66	7.2614	89	2.1041
21	14.6908	44	11.0954	67	7.0729	90	1.8506
22	14.4836	45	10.9689	68	6.9009		
23	14.3026	46	10.8665	69	6.7510		

The Use of the preceding Tables.

Let it be required to find the *Value* of an *Annuity* of 50 *l.* upon the *Life* of a Person 14 Years of Age, Money being valued at 3 per Cent.

In the *Table* at 3 per Cent. against the Age of 14 is 18.4877 Years Value or Purchase, which multiplied by 50 the *Annuity*, the Product is 924.385 = 924 *l.* 7 *s.* 8 $\frac{1}{4}$ *d.* the *Value* of the *Annuity* sought. And thus the *Value* of the said *Annuity* on the same Age at 4 per Cent. may be found by the 4 per Cent. *Table* to be 822.61 = 822 *l.* 12 *s.* 2 $\frac{1}{2}$ *d.*

2^d. So that the *higher* the Rate of Interest is, the *less* is the Value of *Annuities*.

By comparing *these Tables of Annuities on Lives* with the 5th Table of *Compound Interest*, the *certain* Annuity may be found equal in Value to an Annuity on any *Life*. For Instance, Suppose it were required to find the *certain Annuity* equal in Value to an Annuity on a *Life* of 14 Years of Age, which is worth 18.4877 Years purchase at 3 *per Cent.* as appears by the 3 *per Cent. Table of Annuities on Lives*.

By entering the 5th Table in the Column under the same Rate, namely, 3 *per Cent.* with the said 18.4877 Years Purchase, you will find that it is greater than the Value of an Annuity certain for the Term of 27 Years (that being 18.327 Years Purchase) and less than the Value of an Annuity certain for the Term of 28 Years, (which is 18.7641 Years Purchase) and by making a proportionable Allowance for the Excess of 18.4877 the given Annuity, above 18.327 the Value of an Annuity certain for 27 Years, you will find that the Value of an Annuity on a Life of 14 Years of Age, is equal to the Value of an Annuity certain for the Term of 27.3676 Years. Which *certain Annuity* is equal in Value to the said Life, supposing Money to be valued at any other Rate of Interest; for by applying to the 5th Table, in the Column under 4 *per Cent.* with 16.4522 Years Purchase, the Value of the aforesaid Life at that Rate of Interest, and making a proportionable Allowance for the Excess of 16.4522 above 16.3296, the Value of an Annuity certain for 27 Years at 4 *per Cent.* you will find the Annuity for Life equal in Value to an Annuity certain for the same Term as before, namely, 27.3676 Years.

In like Manner, the Value of an Annuity on a Life of 1 Year will be found equal to an Annuity certain for the Term of 20.8031 Years: And the Value of a Life of 2 Years of Age, equal in Value to an Annuity certain for the Term of 25.4039 Years: And so on, as in the following Table, which shews the *certain Annuities* equal in Value to *Annuities on Lives* from the Age of 1 Year to 90.

The Value of Lives upon Annuities certain.

Years certain.	Years certain.	Years certain.	Years certain.	Years certain.	Years certain.
1	20.8031	24	21.1984	47	14.2064
2	25.4239	25	20.7482	48	13.9138
3	28.5901	26	20.3684	49	13.6317
4	30.1599	27	19.9842	50	13.3574
5	30.650	28	19.6063	51	13.0808
6	30.8037	29	19.2116	52	12.8201
7	30.7446	30	18.8923	53	12.5732

10	29.9499	33	17.9157	56	11.7081
11	29.3152	34	17.6007	57	11.4068
12	28.7015	35	17.2824	58	11.1128
13	28.0374	36	16.9622	59	10.8356
14	27.3676	37	16.6505	60	10.5774
15	26.6531	38	16.3363	61	10.3349
16	25.8395	39	16.0204	62	9.9932
17	25.0285	40	15.7941	63	9.6977
18	24.3063	41	15.5632	64	9.349
19	23.6799	42	15.3755	65	9.0395
20	23.0855	43	15.2019	66	8.752
21	22.5901	44	14.9586	67	8.484
22	22.0801	45	14.7308	68	8.239
23	21.6480	46	14.5164	69	8.025

By Help of *this Table* and the 5th *Table of Compound Interest*, the Value of any single Life from 1 to 90 Years of Age at any of the Rates of Interest in the said 5th *Table* may be readily found. For Instance, Suppose it were required to find the Value of a Life of 50 Years of Age, Interest at 3½ per Cent.

First, by the above Table, a Life of 50 Years of Age is found equal to an Annuity certain for the Term of 13.3574 Years; then entering the 5th *Table*, in the Column under 3½ per Cent. I find, that an Annuity certain for a Term of 13 Years is worth 10.3027 Years Purchase, and that an Annuity certain for a Term of 14 Years is worth 10.9205 Years Purchase, and by making a proportionable Allowance

ance for the Decimal .3574, we shall have .2208, which added to 10.3027, the Value of an Annuity certain for 13 Years, the Sum is 10.5235, which shews that a Life of 50 Years is worth 10.5235 Years Purchase, at the Rate of $3\frac{1}{2}$ per Cent. And after the same Manner may the Value of any other Life be found at any Rate of Interest in the said 5th Table.

The last Table is also useful in finding the Value of a *Reversion* for so many Years, to commence at the Death of a Person.

E X A M P L E.

What's the present Worth of an Estate for 10 Years after the Death of a Person of 64 Years of Age, at $4\frac{1}{2}$ per Cent. ?

By the foregoing Table, a Life of 64 Years is equal in Value to an Annuity for 9.349 Years certain, but rejecting the Decimals, it will be near enough for our present Purpose to reckon the Life equal in Value to an Annuity for 9 Years certain.

Then $9 + 10 = 19$ Years.

And by Table 5th, under $4\frac{1}{2}$ per Cent.

an Ann. for 19 Years is worth	12.5933	} Years Purchase
And an Annuity for 9 Years,		
is worth	7.2688	
<hr/>		
Which subtract, the Rem. is,	5.3245	

Which is the *Worth* of the Reversion for 10 Years.

Mr. *Hodgson* makes it appear from the afore-mentioned Bills of Mortality, that out of every thousand Persons supposed to be born at the same Time, no more than 710 lived to the Age of one Year, 614 to the Age of two Years, &c. as in the following Table, where the 1st, 3d, &c. Columns shew the Ages, the 2d, 4th, &c. the Number of Persons that lived to that Age. From which Table he deduces the Computations whereby the Tables, Page 228 and 229, are constructed, and also shews by it how

how the Value of an Annuity on any Number of Lives of equal Ages may be easily found.

Ages.	Living.	Ages.	Living.	Ages.	Living.	Ages.	Living.	Ages.	Living.	Ages.	Living.
Born	1000	10	473	32	367	42	220	64	105	80	29
1	710	17	471	33	358	49	212	65	99	81	26
2	614	18	468	34	349	50	204	66	93	82	23
3	564	19	464	35	340	51	196	67	87	83	20
4	539	20	459	36	331	52	188	68	81	84	17
5	526	21	453	37	322	53	180	69	75	85	14
6	516	22	447	38	313	54	172	70	69	86	12
7	508	23	440	39	304	55	165	71	64	87	10
8	501	24	433	40	294	56	158	72	59	88	8
9	495	25	426	41	284	57	151	73	54	89	6
10	490	26	418	42	274	58	144	74	49	90	5
11	486	27	410	43	264	59	137	75	45	91	4
12	482	28	402	44	255	60	130	76	41	92	3
13	479	29	394	45	246	61	123	77	38	93	2
14	477	30	385	46	237	62	117	78	35	94	1
15	475	31	376	47	228	63	111	79	32	95	0

To shew the Use of the foregoing Table, in regard to Annuities on any Number of Lives of equal Ages, Let the Value of an Annuity be required on the *joint Lives* of 2 Persons 10 Years of Age, to continue during the Life of the Survivor.

You will find by the Table, that out of 1000 Persons supposed to be born at the same Time, no more than 490 are living at the Age of 10 Years, which Number being divided by 2, (the Number of Persons on whose Lives the Value of the Annuity is required) the Quotient is 245, and the nearest Number in the Table to 245 is 246, the Number of Persons living at 45 Years of Age; so that of the 490 Persons living at 10 Years of Age, one out of two lives to the Age of 45, which being 35 more than 10; Hence the *Value* of an Annuity on the *Lives* of 2 Persons of 10 Years of Age, is equal to an *Annuity certain* for the Term of 35 Years.

H h

Again

Again, Let the Value of an Annuity be required on the *joint Lives* of 3 Persons of 21 Years of Age. It appears by the Table, that the Number of the Persons living at 21 Years of Age is 453, which divided by 3, the Quotient is 151, which appears to be the Number of Persons living at 57 Years of Age; so that of the 453 Persons living at 21 Years of Age, one out of three Lives to the Age of 57 Years, from which subtract 21, the Age of the Persons on whose Lives the Value of an Annuity is required the Remainder is 36; hence an *Annuity* on the *said Lives* is of equal Value with an *Annuity certain* for the Term of 36 Years. And thus may the Value of an Annuity be found on any Number of Lives of any equal Age.

C H A P. X.

Of Circulating or Repeating Decimals, *their Use, &c.*

1. **W**HEN the *Denominator* of a Vulgar Fraction is an aliquot Part of the *Numerator* increased by affixing Cyphers thereto, the Decimal equivalent to such a Fraction, will be compleat and terminate, as $\frac{1}{2}=.5$; $\frac{1}{4}=.25$; $\frac{1}{20}=.05$; $\frac{1}{125}=.008$; $\frac{1}{800}=.00125$.

2. But if the *Denominator* be no aliquot Part of the *Numerator* thus increased, the Decimal equivalent to such a Fraction will be interminate or endless; that is, it will constantly repeat one Digit only; as $\frac{1}{3}=.3333$, &c. *ad infinitum*; or $\frac{2}{3}=.6666$, &c. or $\frac{7}{12}=.583333$, &c. or $\frac{5}{16}=.3125$, &c. *sine fine*.

3. Or else a certain Number of Figures perpetually circulate, or repeat in the Quotient. Thus, $\frac{1}{11}=.090909$, &c. *ad infinitum*; also, $\frac{2}{11}=.181818$, &c. and $\frac{3}{11}=.272727$, &c. without End.

4. And those Numbers which thus infinitely circulate or repeat are termed *Repetends*. Those which circulate a Digit only, are called a *Single Repetend*; and those in which several Figures circulate, are called a *Compound Repetend*. And it is usual to dash the first and last of the repeating Figures, thereby making one Place of the *Repetenda* sufficient. Thus the Examples above are thus wrote or expressed; $.3$; $.6$; $.58\dot{3}$; $.13\dot{8}$. And the *Compound Repetends* thus; $.09\dot{09}$; $.18\dot{18}$; $.27\dot{27}$; and $.013\dot{6}$.

5. In a *Compound Repetend*, any one of the circulating Figures may be made the first of the Repetend; for instance, in the Repetend, 8.6325325 , &c. it may be made, $8.63\dot{2}53$; or $8.6325\dot{3}$. And by this Means any two or more Repetends may be made to begin and end in the same Place; and then they are said to be *contiguous*.

SECT. I. ADDITION of Repeating Decimals.

C A S E I.

If they are *Single Repetends*, make them all *conterminous*, then add as usual, only to the last, or Right-hand Place of Decimals, add as many *Units* as there are *Nines* in it, and that *last Digit* will be a *Repetend*.

E X A M P L E S.

124.233	5.91666	4.727083
64.516	0.02083	2.583333
0.333	2.56266	0.002083
59.800	4.83333	9.029166
3.833	9.04166	4.031250
45.026	2.66666	17.035756
<hr/>	<hr/>	<hr/>
Sum 297.743	Sum 120.4176	Sum 37.408673
<hr/>	<hr/>	<hr/>

C A S E II.

If the Decimals are *Compound Repetends*, (tho' the foregoing Chapters shew that 5 or 6 Places of Decimals are generally sufficient, yet) to have the Sum compleat, this Rule must be observed.

From the Place where all the Repetends *begin together*, continue each Decimal to a Number of Places equal to the *least common Multiple* of those several Numbers which represent the Places of Figures in the said Repetends; then add, and to the last Place add as many Units as there are 10's in the Place where the Repetends all begin together, and the Figures in those two Places, are the *first* and the *last* of the *Repetend*.

Note

Note, One Number is said to be the *Multiple* of another, when it contains a certain Number of Times without any Remainder.

To find the least *common Multiple* of any two Numbers, observe these Directions.

1. If a Number *cannot* be found that is an aliquot Part of both the given Numbers, the *Product* of the said Numbers multiplied together, will be the least *common Multiple* required; thus the least *common Multiple* of the Number 3 and 7 is 21, equal to 7×3 .

2. If a Number *can* be found that is an aliquot Part of both the given Numbers, *divide* either of the given Numbers by it, and the *Quotient* multiplied by the other given Number, will be the least *common Multiple* of the said Numbers; for Instance, what is the least common Multiple of the Numbers 6 and 8? here 2 is an aliquot Part of both Numbers, and $6 \div 2 = 3$, and $3 \times 8 = 24$, the least *common Multiple* required.

If the least *common Multiple* of more than two Numbers be required, first find the least common Multiple of any two of the Numbers; for Instance, what is the least *common Multiple* of the Numbers 2, 3, and 4? First, the least common Multiple of 2 and 3, is 6, (*per Direction 1.*) And the least *common Multiple* of the Number last found, namely, 6, and the other given Number 4, is 12 (*per Direction 2d.*) So that 12 is the least *common Multiple* of the Number, 2, 3, and 4. In like Manner you may proceed to find the least *common Multiple* of 4, 5, or more different Numbers.

Examples in Addition of Compound Repetends.

13.8467	14.472958	121.47287
2.8043	12.807248	80.27555

105.7105	7.870707	4.731473147314
Sum 571.4278	25.460128	16.530107431099

Note, If a *compleat* or *terminate* Decimal be to be added with the *Repetends*, you must affix Cyphers thereto, to esteem and deal with them as *Repetends*.

S E C T. II.

SUBTRACTION of Repeating Decimals.

C A S E I.

If the Decimals *repeat Single Figure*, proceed to place them as in the 1st *Case* of *Addition*, and subtract as usual; except that when the Subtrahend is the greater Number, you must increase the upper Figure by 9 only, and in every such *Case* carry one to the next Place.

E X A M P L E S.

From	54.73333	57.5283	1672.4516	47.957200
Subtract	17.95416	49.5833	879.3000	.08316
Remains	36.77916	7.9453	793.1516	47.948883

C A S E II.

If the Decimals be *Compound Repetends*, order them as directed in the 2nd *Case* of *Addition*; and look if you must borrow one in the Place where *both Repetends* begin together; if so, you must add one to the right hand Place of the *Subtrahend*; and that Figure in the Remainder under

Multiplication of Circulating Decimals. 239

under the Place where both Repetends begins together will be the *first*, and the right hand Figure the *last* of the *Repetend*.

EXAMPLES.

From	47.4578178	153.02749	75.5333
Subtract	15.8656565	142.85353	42.7597
Remains	<u>31.8521612</u>	<u>11.07395</u>	<u>32.7735</u>
From	47.8340260	75.258000	49.8285285
Subtract	40.9359259	47.856363	38.4730000
Remains	<u>6.9981001</u>	<u>27.9114436</u>	<u>11.0549285</u>

SECT. III.

MULTIPLICATION of repeating Decimals.

CASE I.

If the *Multiplicand* be a *Repetend* only, and the *Multiplicand* a *Single Digit*, multiply as usual; only observe to add in the *last Place* of the *Product* as many *Units* as it contains *Nines*, and that Place is a *Repetend*.

EXAMPLES.

Multiply	10.7016	9.303	476.03
by	5	7	.08
Product	<u>53.5083</u>	<u>65.131</u>	<u>38.0844</u>

Burt

But if the *Multiplier* consists of *several* Digits or Figures, then make each particular Product *contermineus*, by continuing the *single* Repetend of each toward the right hand.

E X A M P L E.

$$\begin{array}{r}

If the Divisor be only a *Single Repetend*, and the Dividend be either a *terminate Number* or contains a *Repetend*, place the Dividend under itself, but *one place forward* to the right hand, and then Subtract, the Remainder will be a *new Dividend*, then divide as usual, and the Quotient will be either *terminate*, *repeat a Single Digit*, or else a *Compound Repetend*.

EXAMPLE

EXAMPLE.

Divide 572.4 by .8
57.24

.8)515.16(= the new Dividend
 48 643 95 the true Quotient.

35

32

31

24

76

72

40

40

..

Otherwise thus, multiply the Dividend by 9, cutting off one more right hand Figure in the Product, which will be a new Dividend the same as before.

The Dividend 572.4 as before
 multiply by 9

The Product 515.16 a new Dividend as before.

'Tis plain that both these Ways will give the same Quotient, and that the Quotient this way produced is the *only true one*, will appear from the Work of the last Example at large.

$$\begin{array}{r|l}
 .8)572.4 & 8000 \text{ \&c.} (643.95 \\
 5333 & 3333 \text{ \&c.} \\
 \hline
 390 & 8666 \text{ \&c.} \\
 385 & 5555 \text{ \&c.} \\
 \hline
 35 & 1111 \text{ \&c.} \\
 28 & 6666 \text{ \&c.} \\
 \hline
 8 & 4444 \text{ \&c.} \\
 8 & 8000 \text{ \&c.} \\
 \hline
 & 4444 \text{ \&c.} \\
 & 4444 \text{ \&c.} \\
 \hline
 & \dots
 \end{array}
 \left. \vphantom{\begin{array}{r|l} .8)572.4 \\ 5333 \\ 390 \\ 385 \\ 35 \\ 28 \\ 8 \\ 8 \end{array}} \right\} \text{ad inf. nitum.}$$

In this Operation, 'tis manifest though the *Repetends* in every particular Step would proceed to *Infinity*, yet in the last Place you see there is an *infinite Product* equal to an *infinite Remainder*; and consequently the Work must there cease, and the Quotient nevertheless be *true*.

} *ad infinitum.*

In Division it may often happen that the Quotient may *not repeat* so soon as is desired; in such Case it may be continued to any Number of Places at Pleasure.

The *Reason* of the different Methods and peculiar Processes used in the *Arithmetic* of *Circulating Numbers*, called *Repetends*, will appear from the following *Lemmas* and *Corollaries*.

L E M M A. I.

A Series of Nines infinitely continued, is equal to Unity, or One, in the next Left-hand Place; thus, 0.999 &c. is equal to 1; and .0999 &c.=.1; and .00999 &c.=.01; and 54.999 &c.=55.

De-

Demonstration. 'Tis evident that $.9 = \frac{9}{10}$ wants only $\frac{1}{10}$ of Unity ; and $.99$ wants $\frac{1}{100}$; $.999$ wants $\frac{1}{1000}$; so that if the Series were continued to *Infinity*, the Difference between that Series of Nines and an Unit, would be equal to Unity divided by *Infinity*, that is, *Nothing* at all. Q. E. D.

L E M M A II.

Any Single Repetend divided by 10, and the Quotient subtracted from the said Repetend, the Remainder will be the same Number compleat or terminate.

Demonstration. Let the given Repetend be 6.666 &c. this divided by 10, the Quotient is .666 &c. which Quotient subtracted from 6.666 &c. the Remainder is 6.

Thus 477.77 &c. will become 430 and .3333 &c. will be .3. Q. E. D.

C O R O L L A R Y I.

Hence it follows, that if any Compound Repetend be divided by an Unit with so many Cyphers annexed as are equal to the Places of the Repetend, and the Quotient subtracted from the said Repetend, the Remainder will be the same Number compleat or terminate, that constituted the Repetend ; thus, 325.325 divided by 1000 is .325, which subtracted from 325.325, the Remainder is 325 : Thus .0743 will be .0743 ; and 12.743 will be 12.731 ; and 5275.3 will become 5270.1.

C O R O L L A R Y II.

Hence also, if any Repetend be divided by an Unit with as many Cyphers as it contains Places, and the Quotient multiplied by as many Nines as the Repetend contains Places, the Result will be the same as before ; that is, the same Number terminate or compleat, for any Number divided by 10, and the Quotient subtracted, the Remainder is the same as the Quotient multiplied by Nine.

Thus

Thus $6.666 \text{ \&c.} \div 10 = .6666 \text{ \&c.}$

And $.6666 \text{ \&c.} \times 9 = 5.999 \text{ \&c.} = 6$ (by Lemma 1.)
and 6 is equal to $6.666 \text{ \&c.} - .666 \text{ \&c.}$

Again, $325.325 \div 1000 = .325$.

And $.325 \times 999 = 324.999 \text{ \&c.} = 325$ (by Lemma 1.)
and 325 is equal to $325.325 - .325$.

C O R O L L A R Y III.

It is evident from the last *Corollary* that a *Single Repetend* is to the same Number terminate or compleat, as 10 is to 9; a *Compound Repetend of two Places*, as 100 to 99; and a *Compound Repetend of three Places* is to the same Number terminate or compleat, as 1000 is to 999, &c. And by the *Converse* of the said *Corollary* it must follow, that any Number multiplied by 1 with as many Cyphers as it contains Figures, and the *Product* divided by as many *Nines*, will give the same Number perpetually circulating.

Thus $6 \times 10 = 60$, and $60 \div 9 = 6.666 \text{ \&c.}$

And $325 \times 1000 = 325000$, and $325000 \div 999 = 325$.

C O R O L L A R Y IV.

Hence also, if any Number be divided by as many *Nines* as it contains Figures, and the *Quotient* added to the said Number, the Result will be the same as before; for any Number multiplied by 10, and the *Product* divided by 9, the *Quotient* must be equal to $\frac{1}{9}$ of the same Number added to itself.

Thus the *Quotient* of $6 \div 9$ added to 6 = 6.666 \&c.

And the *Quotient* of $325 \div 999$ added to 325 = 325.

L E M M A III.

Any Number divided by 9. 99. 999. &c. will be equal to the *Sum* of the *Quotients* of the same Number continually divided by 10. 100. 1000. &c. as appears from the following

following Examples, where the *Sum* of the Quotients of 737, continually divided by 10, is found to be the same as 737 divided by 9. And the *Sum* of all the Quotients of 236847, continually divided by 1000, is equal to the same Number divided by 999. See the Work.

SCHOLIUM.

From the preceding *Lemma* and *Corol.* 4. appears the Reason of finding the *true Product*, as directed in the 2nd. *Case of Multiplication*, and the Reason of multiplying by 10 and dividing by 9, as directed in the 1st *Case*, is evident from *Corol.* 3. And the Reason of the *Rules in Division* are obvious from *Lemma* 2. and *Corol.* 1 and 2.

B's Share	28.3228	=	28	: 6 : 5½
C's Share	32.18636	=	32	: 3 : 8½

The Gain $100.74383 = 100 : 14 : 10½$

Quest.

Quest. 8. What is the Simple Interest of 247 *l.* 13 *s.* 4 *d.* = 247.6 for 2 Years, and 156 Days, at 4 per Cent. ?

$$\begin{array}{r}
 \text{First,} \quad \begin{array}{r} \text{\textit{l.}} \\ 247.6 \\ .04 \end{array} \\
 \hline
 9.906 \quad \text{the Interest for 1 Year.} \\
 \hline
 \end{array}$$

Next mult. the Time $\begin{array}{r} \text{\textit{Years.}} \quad \text{\textit{Yrs. Days.}} \\ 2.427398 = 2 : 156 \end{array}$
by 9.909 the Interest for 1 Year.

$$\begin{array}{r}
 21.8466 \\
 2.1846 \\
 146 \\
 14 \\
 1 \\
 \hline
 \end{array}$$

$\begin{array}{r} \text{\textit{l.}} \quad \text{\textit{s.}} \quad \text{\textit{d.}} \\ 24.0473 = 24 : - : 11\frac{1}{4} \end{array}$ the Interest required.

Note, In contracted Multiplication, when there is a *single Repetend* in the Multiplier, the first Product of such Repetend (which in this Example is .0146) must be continually repeated, placing it each Time one Figure to the Right-hand, till (by rejecting at the same Time the Right-hand Figure as of no Value) the Product terminates in a single Digit.

Quest.

Quest. 9. How much Money of *Amsterdam* will 543 *l.*
6 *s.* 8 *d.* *Sterling* = *l.* 543.3 come to at 36 *s.* *Flem.* per *l.*
Sterling?

<i>s.</i>	543.33 at 1 <i>l.</i> 16 <i>s.</i>	Or thus.
10 - $\frac{1}{2}$	271.65	543 at 36 <i>s.</i>
5 - $\frac{1}{2}$	135.83	36
1 - $\frac{1}{5}$	27.16	<hr/>
		3260
	978.00 <i>l.</i> <i>Flem.</i>	1630
Mult.	6	<hr/>
		19560 Schillings.
Answer	5868 Guil.	Mult. .3
		<hr/>
		5868.0 Guilders as before.

Quest. 10. How much much Money of *Hamburg* will
72 *l.* 12 *s.* 8 *d.* *Sterl.* come to at 35 *s.* 2 *d.* *Flem.* per *l.*
Sterl.?

	72.68 at 35 : 2	
Mult.	105	3
	<hr/>	<hr/>
	363.165	105 : 6
	7268.333	
$\frac{1}{2}$	36.316	
	<hr/>	
	8)7662.816	
	<hr/>	
	957.852

 \hline
 3 : 4 - \frac{1}{2} \quad 156.66 \\
 \quad 10 - \frac{1}{4} \quad 39.16 \\
 \hline
 \text{Answer} \quad 195.83 = 195 \text{ l. } 16 \text{ s. } 8 \text{ d.} \\
 \hline
 \end{array}$$

It is plain by these Questions, that understanding the Management of *Repetends* is sometimes serviceable in Computations relative to Business, not that the Knowledge of them is absolutely necessary in performing the said Questions, because any of them may be worked decimally without, but then they would require more Places of Decimals, and consequently more Figures in the Operation.

In the next Place, that nothing useful may be here wanting in regard to *circulating Numbers*, I shall insert two or three Problems for finding the *Logarithm* of them, which may be acceptable to those who are already acquainted with Logarithms, but perhaps may not know the Manner of finding the *Logarithm* of *Repetends*.

S E C T. VI. Problems for finding the Logarithm of Repetends.

Previous to the Problems, it may be proper to shew how to find the *Arithmetical Complement* of any *Logarithm*. This is done by subtracting each Figure of the given Logarithm (beginning at the Left-hand) from 9, and the last from 10. Thus the *Arithmetical Complement* of the Log. 3.8649262 will be found 6.1350738.

Note, It must be observed in the following Examples, and in all Operations of the like Kind, that the *Indexes* of the *Arithmetical Complements* are omitted.

P R O.

P R O B L E M I.

To find the *Logarithm* of a single Repetend, or circulating Digit.

Rule. To the *Tabular Logarithm* of the Digit, add the *Arithmetical Complement* of the *Logarithm* of 9, the Sum is the *Log.* sought.

Example. Required the *Logarithm* of β .

To the *Tabular Logarithm* of — 6 = 0.7781512

Add the *Arith. Comp.* of the *Log.* 9 = 0.0457575

The Sum is the *Logar.* sought of β = 0.8239087

P R O B L E M II.

To find the *Logarithm* of any pure Compound Repetend.

Rule. To the *Tabular Logarithm* of the Number (as terminate) add the *Arithmetical Complement* of the *Logarithm* of so many 9's, as there are Places of the Repetend; the Sum is the *Logarithm* of the given Repetend.

Example 1. Required the *Logarithm* of the Compound Repetend $\frac{24}{99}$.

To the *Tabular Logarithm* of — 24 = 1.3802112

Add the *Arithmetical Complement* of 99 = 0.0043648

The Sum is the *Logarithm* of $\frac{24}{99}$ = 1.3845760

Example 2. Required the *Logarithm* of $36.\bar{5}$

To the *Tabular Logarithm* of — 36.5 = 1.5622929

Add the *Arithmetical Complement* of 999 = 0.0004345

The Sum is the *Logarithm* of $36.\bar{5}$ = 1.5627274

Examp.

Example 3. Required the Logarithm of $374\bar{6}$.

$$\begin{array}{rcl} \text{To the Tabular Logarithm of} & 3746 & = 3.5735678 \\ \text{Add the Arith. Comp. of the Log. of} & 9999 & = 0.0000434 \\ \hline \text{The Sum is the Logarithm of} & 374\bar{6} & = 3.5736112 \end{array}$$

Example 4. Required the Logarithm of $400.6\bar{6}$.

$$\begin{array}{rcl} \text{To the Tabular Logarithm of} & 200.60 & = 2.3023309 \\ \text{Add the Arith. Com. of the Log. of} & 9999 & = 0.0000043 \\ \hline \text{The Sum is the Logarithm of} & 400.6\bar{6} & = 2.3023352 \end{array}$$

PROBLEM III.

To find the Logarithm of any mixed Repetend, either Single or Compound.

Rule. From the given mixed Repetend, subtract its terminate Part; then to the Logarithm of the Remainder add the Arithmetical Complement of the Logarithm of so many Nines, as there are Figures in the Repetend, the sum will be the Logarithm sought.

Example 1. Required the Logarithm of $2.\bar{6}$

$$\begin{array}{rcl} \text{From the given Repetend} & \text{---} & 2.\bar{6} \\ \text{Subtract the terminate Part} & \text{---} & .2 \\ \hline \text{Then to the Logarithm of} & \text{---} & 2.4 = 0.3802112 \\ \text{Add the Arith. Comp. of the Log. of} & 9 & = 0.0457575 \\ \hline \text{The Sum is the Logarithm of} & \text{---} & 2.\bar{6} = 0.4259687 \end{array}$$

Example 2. Required the *Logarithm* of 57.23.

From the given *Repetend* — 57.23
 Subtract the *terminate Part* — 5.72

Then to the *Logarithm* of — 51.51 = 1.7118915
 Add the *Arith. Comp.* of the *Log.* of 9 = 0.0457575

The Sum is the *Log.* of — 57.23 = 1.7576490

Example 3. Required the *Logarithm* of 2.733.

From the given *Repetend* — 2.733
 Subtract the *terminate Part* — 27

Then to the *Logarithm* of — 2.726 = 0.4355258
 Add the *Arith. Comp.* of the *Log.* of 99 = 0.0043648

The Sum is the *Log.* of 2.733 = 0.4398906

Example 4. Required the *Logarithm* of 745.6

From — — 745.6
 Subtract — — 7

To the *Logarithm* of — 724.9 = 2.8602781
 Add the *Arith. Comp.* of the *Log.* of 999 = 0.0004345

The Sum is the *Log.* of — 745.6 = 2.8607126

Example 5. Required the *Logarithm* of 26892.7

From — — 26892.7
 Subtract — — 2.6

To the *Logarithm* of — 26890.1 = 4.4295924
 Add the *Arith. Com.* of the *Log.* of 9999 = 0.0000434

The Sum is the *Log.* of — 26892.7 = 4.4296358

In like Manner may the *Logarithm* of any other *mixed Repetend* be found, so far as the *Canon* of *Logarithms* (you use) will permit.

THE END.

$$\begin{array}{r} 11 \\ 20 \\ \hline \end{array}$$

$$\begin{array}{r} 220 \\ 2 \\ \hline \end{array}$$

$$18$$

$$\begin{array}{r} 222 \\ 18 \\ \hline \end{array}$$

$$12\frac{1}{3}$$

$$\begin{array}{r} 42 \\ 36 \\ \hline \end{array}$$

$$\begin{array}{r} 6 \\ 18 \\ \hline \end{array}$$
